# PERFORMANCE MEASUREMENTS WITH CISCO DEVICES

**SESSION NMS-2042**

*Emmanuel TYCHON*  
**Technical Leader**  
**NMTG – Device Instrumentation**

Based on a presentation developed by David MELTON.

# Recuerde siempre:

Cisco.com

- **Apagar su teléfono móvil/pager, o usar el modo “silencioso”.**

- **Completar la evaluación de esta sesión y entregarla a los asistentes de sala.**

- **Ser puntual para asistir a todas las actividades de entrenamiento, almuerzos y eventos sociales para un desarrollo óptimo de la agenda.**

- **Completar la evaluación general incluida en su mochila y entregarla el miércoles 8 de Junio en los mostradores de registración. Al entregarla recibirá un regalo recordatorio del evento.**

# Objectives

- **This is about**

  - The Process of Performance Management**

  - Outline features inside Cisco Devices and the value they bring to performance management**

  - Case studies for performance measures to be applied to a Service, Network and device**

  - Overview management applications that support Cisco Device Instrumentation**

- **This is NOT about**

  - In-depth description of the Cisco IOS Technologies used for performance measurements**

# Agenda

- **Process of Performance Management**
- **Technologies**
- **Performance Measurements—Case Studies**
  - Availability**
  - Monitoring Service (VoIP Quality)**
  - Monitoring QoS**
  - Element Utilization**
- **Different Scenarios**

# PROCESS OF PERFORMANCE MANAGEMENT

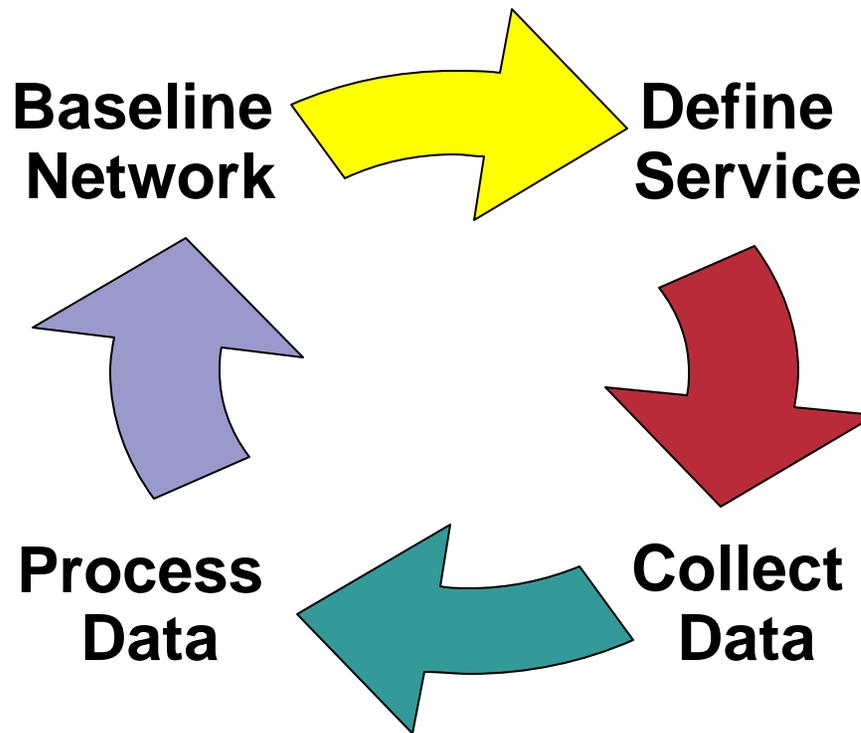

# Reasons for Performance Management

## Good Performance Management Ensures:

- ✓ **Delivery of Customer SLAs**  
**Users can be assured that applications and services will be there when they need them**
- ✓ **Increased Network and Service Reliability**
- ✓ **A better understanding and control of the network**
- ✓ **Deployment of new application and services with complete confidence**

# Performance Management Process

## Measurement examples:

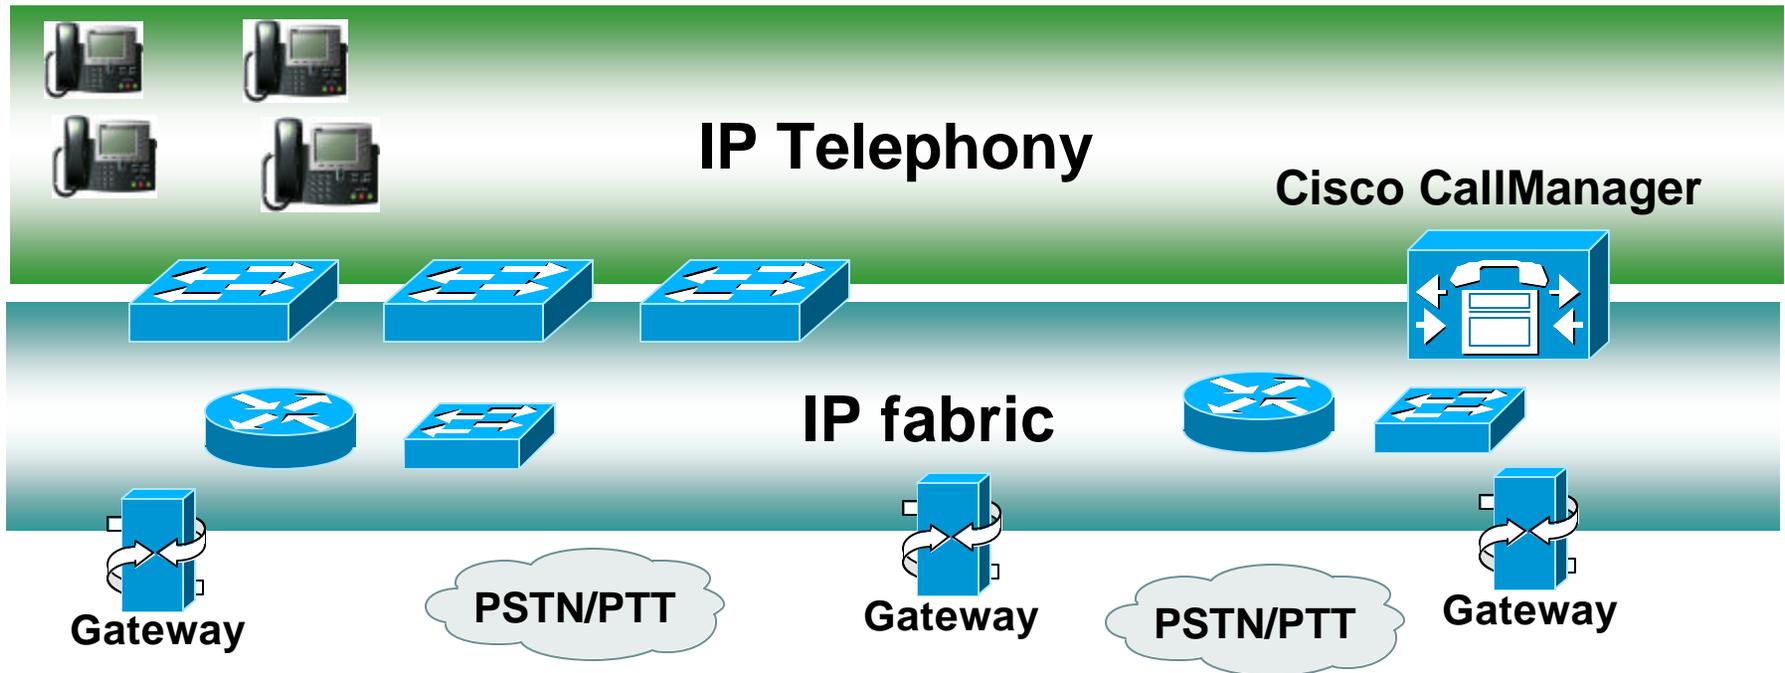

**Service (Customer SLA) + Underlying Data network**

**Voice Quality, Component utilization, response times,...**

# Performance Monitoring: Start at Service Level

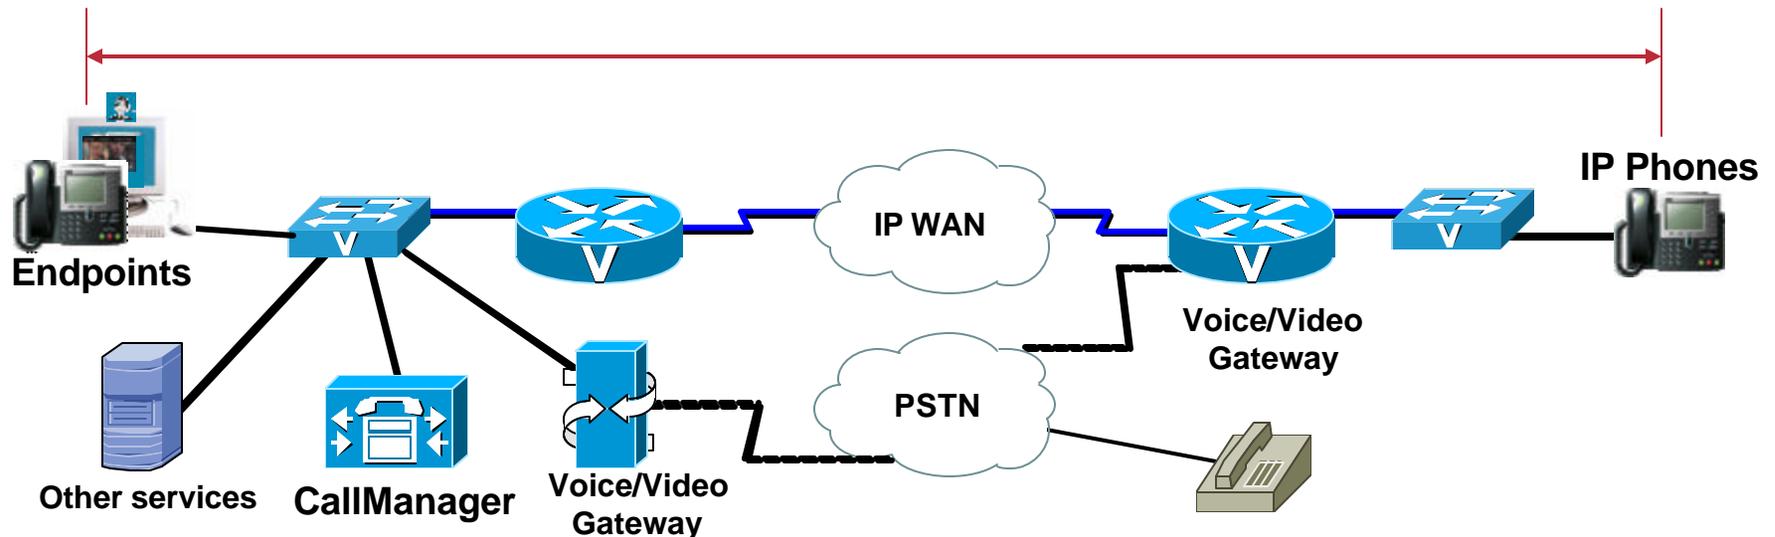

- IP Telephony is a service carried over in IP infrastructure

We need to apply performance monitoring to both

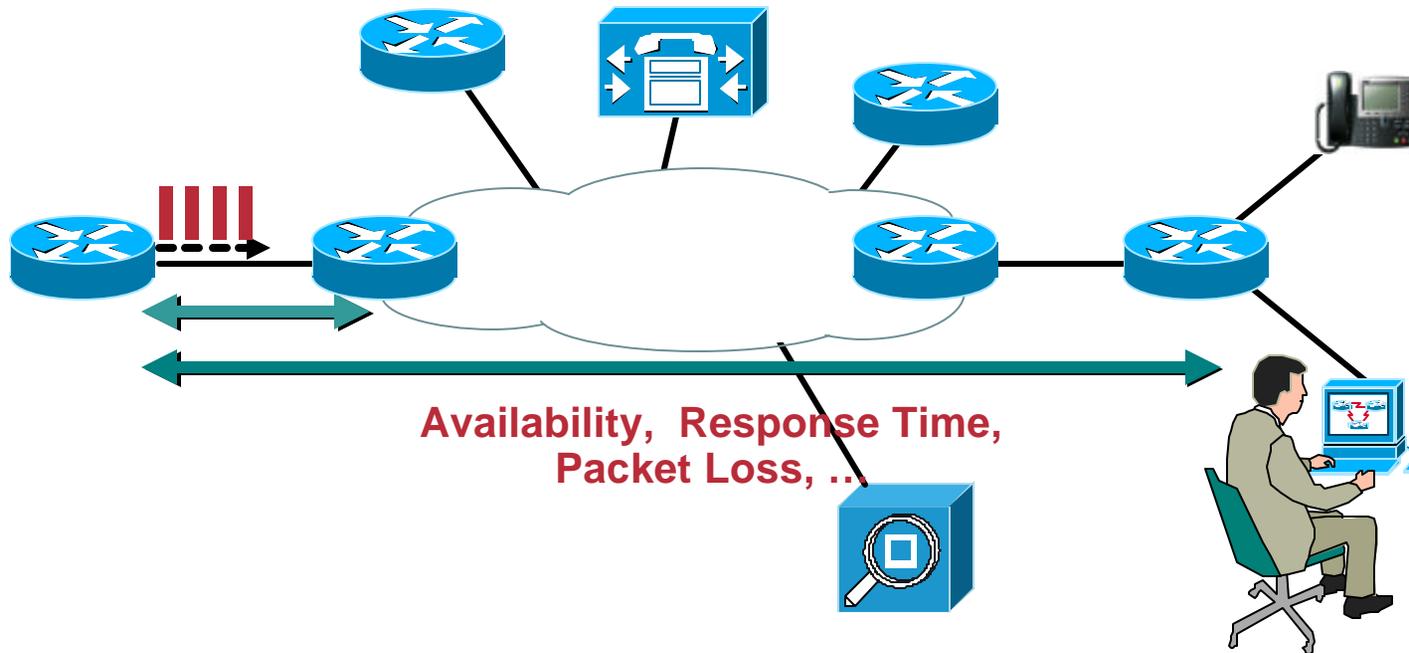

# Monitoring the Service: The Starting Point

- **Monitoring service provides customer view of network performance**
  - If Service measurements are outside of SLAs
    - We have performance issues somewhere in the network
    - We can trace along the path of service to identify performance issues
- **Monitoring at the device level**
  - May identify performance issues
  - Can't tell if these impact on customer service (SLAs)

# Cisco Performance Measurement Technologies

Cisco.com

- **Different technologies**

SNMP Polling, EEM, IP SLAs, RMON, ART MIB, NBAR, QoS, Corvil, and NetFlow

- **With different focus**

Service Wide, Network Wide, Device Wide

# TECHNOLOGIES

# Performance Measurement Technologies

Cisco.com

## SNMP MIBs and Embedded Event Management

**MEASURES:** CPU/Memory Utilization, Availability, QoS

**Sampling:** Passive  
**Collection:** Embedded  
**Scope:** Device/Link  
**Perspective:** User/Network

## NBAR/CORVIL

**MEASURES:** Response Time of Live Application Traffic to Server Device, QoS

**Sampling:** Passive  
**Collection:** External Probe/Embedded  
**Scope:** Link/End-to-End  
**Perspective:** User/Network

## Cisco IPSLA

**MEASURES:** Latency and Jitter Between Source Router and Specified Target

**Sampling:** Active  
**Collection:** Embedded  
**Scope:** Link/End-to-End  
**Perspective:** User/Network

## NetFlow

**MEASURES:** Device Interface Traffic Rate by S/D IP Address, Port Number or AS

**Sampling:** Passive  
**Collection:** Embedded  
**Scope:** Link/End-to-End  
**Perspective:** Network

## Call Manager

**MEASURES:** Voice Calls, Voice Quality, CallManager Performance

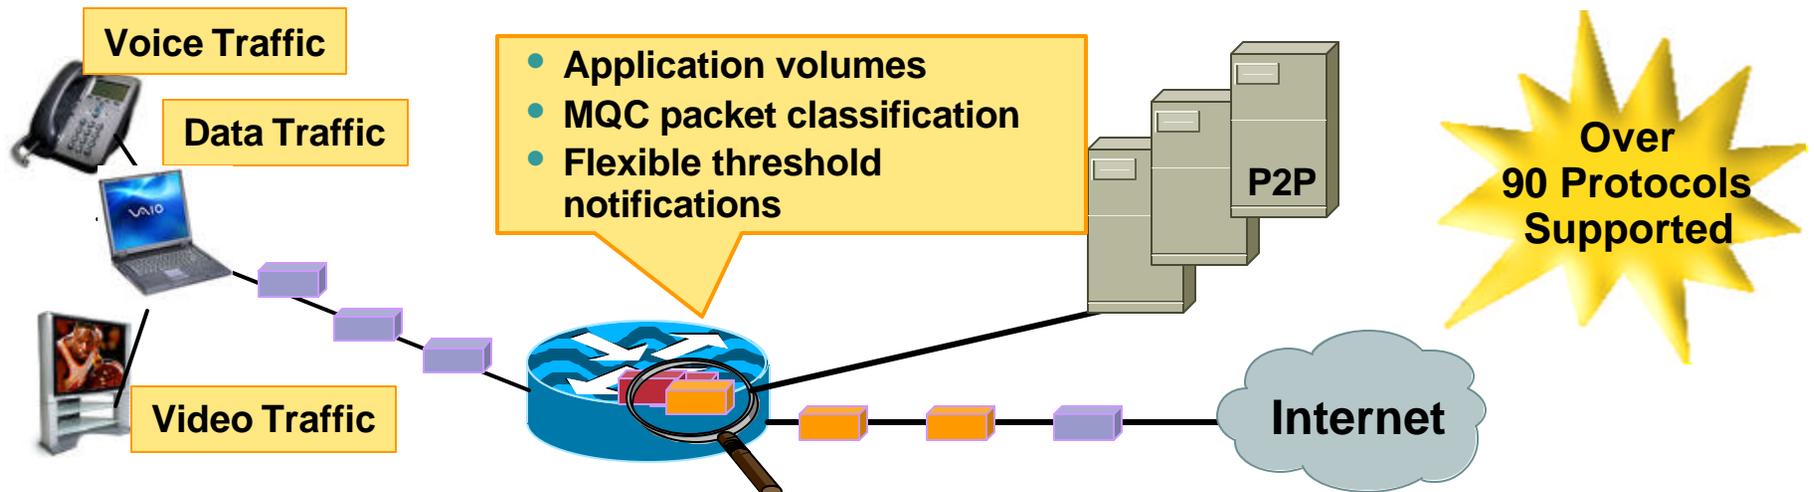

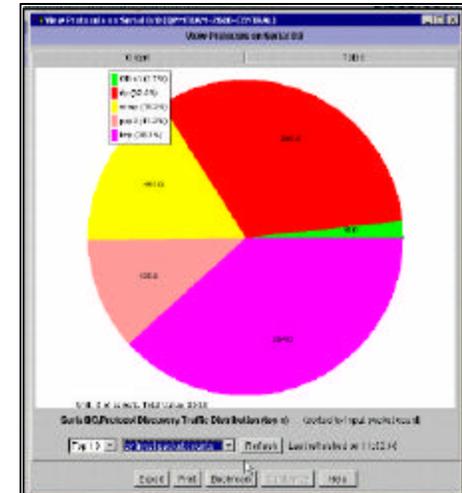

**Sampling:** Passive  
**Collection:** Embedded  
**Scope:** Link/End-to-End  
**Perspective:** User/Network

# Measurement Technology: SNMP

- **Cisco-Voice-Dial-Control-MIB**  
RoundTripDelay, Planning Impairment Factor (ICPIF)
- **Cisco-RTTMON-MIB**  
Collects latest IP SLA measurements and provides on device aggregation of IP SLA measurements.
- **Cisco-Class-Based-QoS-MIB (CiscoCBQosMIB)**  
Primary Accounting Mechanism for QoS
- **IF-MIB**  
Collects bandwidth or link utilisation and packet loss
- **CISCO-PROCESS-MIB and ENTITY-MIB**  
Collect statistics on the CPU utilisation
- **CISCO-MEMPOOL-MIB, CISCO-ENHANCED-MEMPOOL-MIB**  
Collect statistics on the memory utilization

# Measurement Technology: Network-Based Application Recognition-NBAR

- Examines data from Layers 3 through 7
- Uses Layers 3 and 4 plus packet inspection for classification
- Stateful inspection of dynamic-port traffic
- Packet Description Language Modules (PDLMs) define applications recognizable by NBAR
- Customers can specify their own match criteria to identify TCP- or UDP-based applications

# Measurement Technology: NetFlow

- Flows are unidirectional
- Flows are enabled on a per input-interface basis
- Flows are defined by 7 keys:

Source IP address

Destination IP address

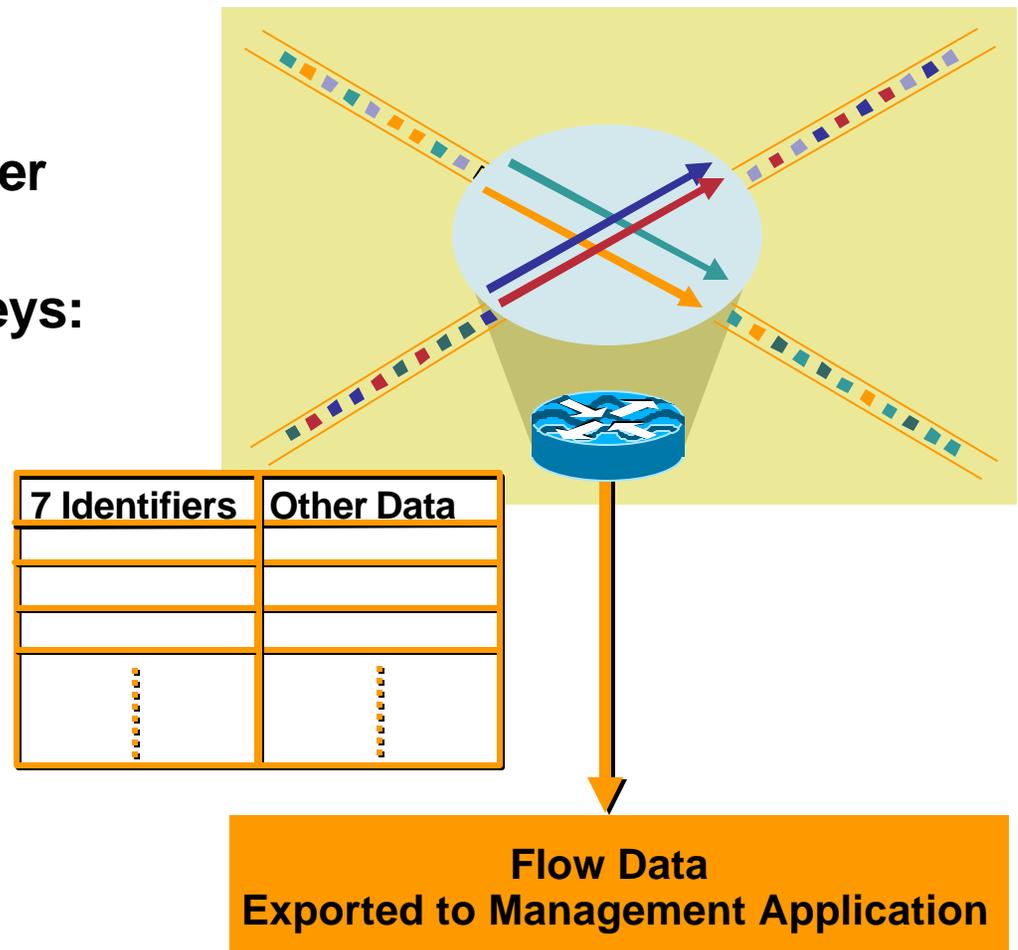

Source port

Destination port

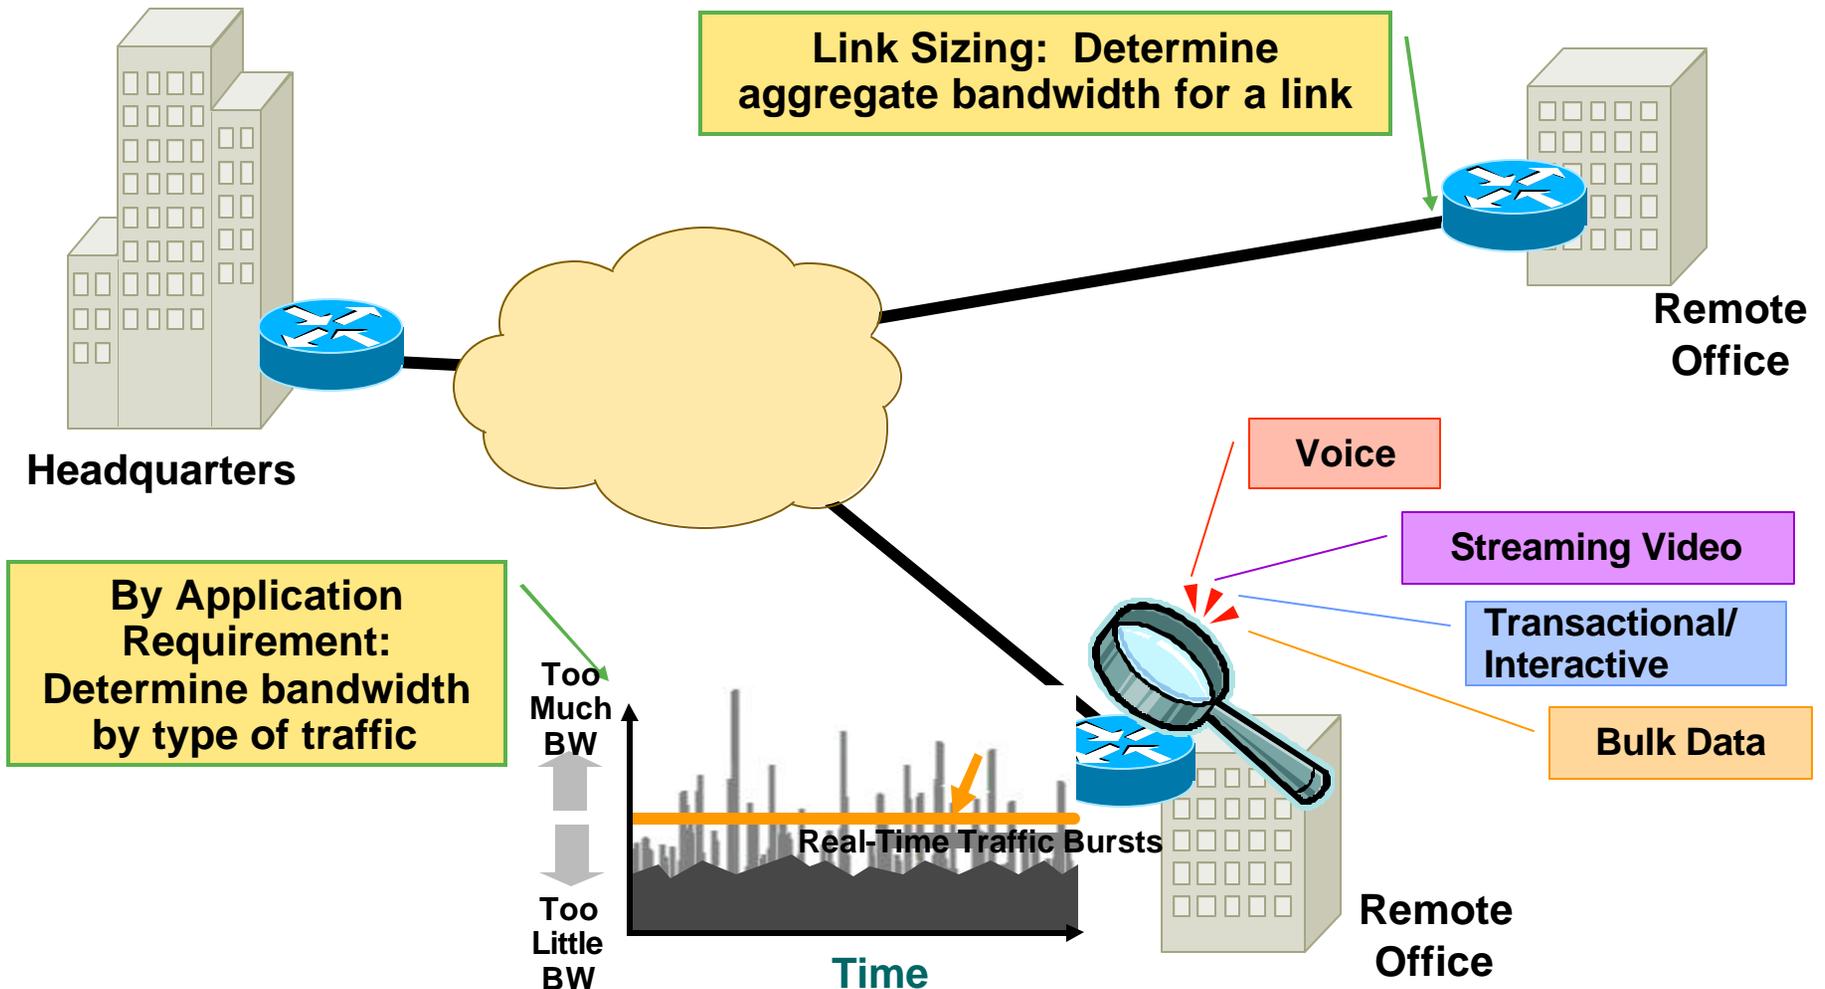

Layer 3 protocol

TOS byte (DSCP)

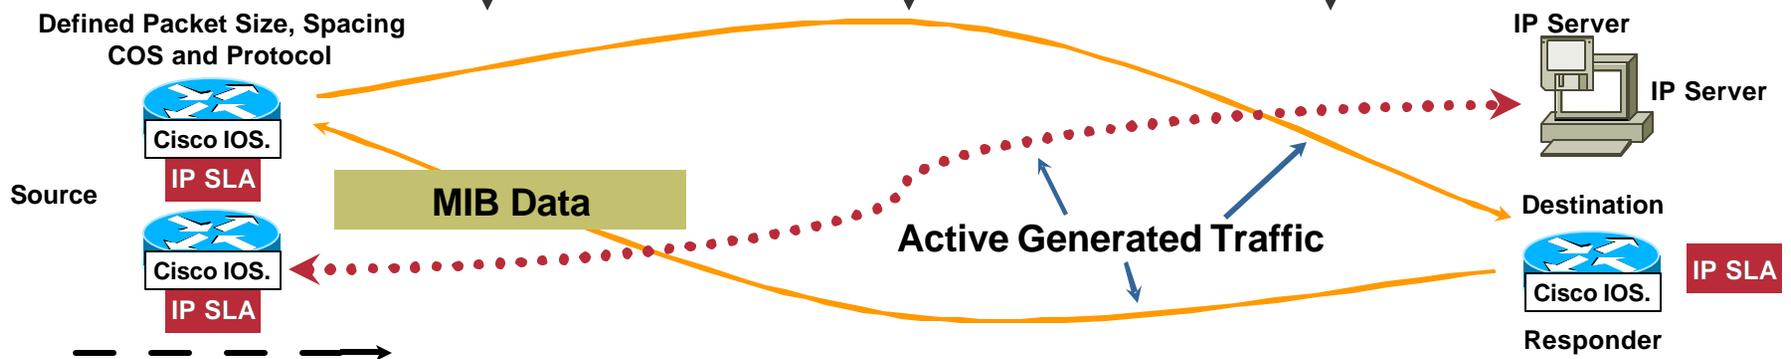

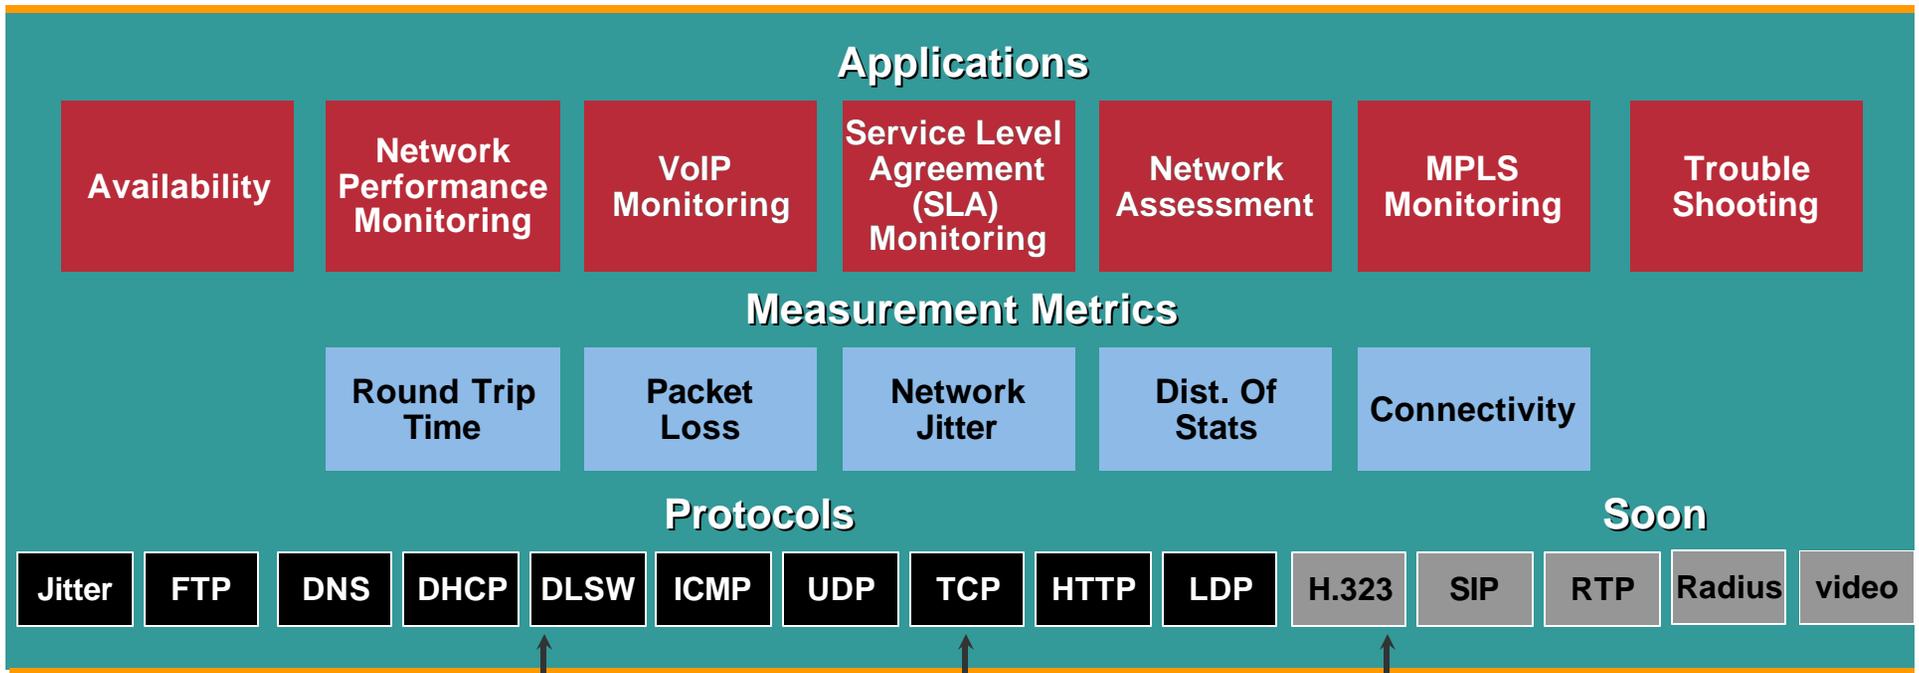

Input interface (ifIndex)

# Measurement Technology: Corvil Bandwidth

# Measurement Technology: IP SLAs

# Measurement Technology: CallManager Serviceability

Cisco.com

- CDR Analysis & Reporting (CAR)
- All Call Management Records (CMRs) have
  - ✓ packets/bytes sent
  - ✓ Packets lost
  - ✓ Jitter
- Real Time Monitoring Tool (RTMT)
  - ✓ Critical system performance CPU, Memory, Disk

The screenshot displays the Cisco CallManager Serviceability web interface. The top navigation bar includes links for User Reports, System Reports, Device Reports, CDR Search, System, Report Config, Help, and Logout. The main header reads "CDR Analysis and Reporting For Cisco IP Telephony Solutions" with the Cisco Systems logo.

The "Traffic Summary" section contains the following controls:

- Generate Report\*: Hour of Day Summary
- Available Reports\*: Generate New Report
- Select Call Types\*:
  - On Net
  - Internal
  - Local
  - Long Distance
  - International
  - Incoming
  - Tandem
  - Others
  - Good
  - Acceptable
  - Fair
  - Poor
  - NA
- Select QoS\*:
  - CSV
  - PDF
- From Date\*: Nov 30 2001
- To Date\*: Nov 30 2001
- Report Format\*:  CSV  PDF

Buttons for "Select All" and "Clear All" are present. The status is "Ready".

The bottom section shows the "Cisco CallManager Serviceability Real-Time Monitoring Tool" interface. It includes a "Summary" sidebar with links for CPU/Memory, Disk Usage, and Critical Services. The main area displays "CPU/Memory" usage history graphs and a "Process at Host" table for SA-CM2-7.

Process	PID	% CPU	PrivateByte	VirtualByte	NumOfHan	ThreadCount	WorkingSet

# CASE STUDY 1: Engineered Availability

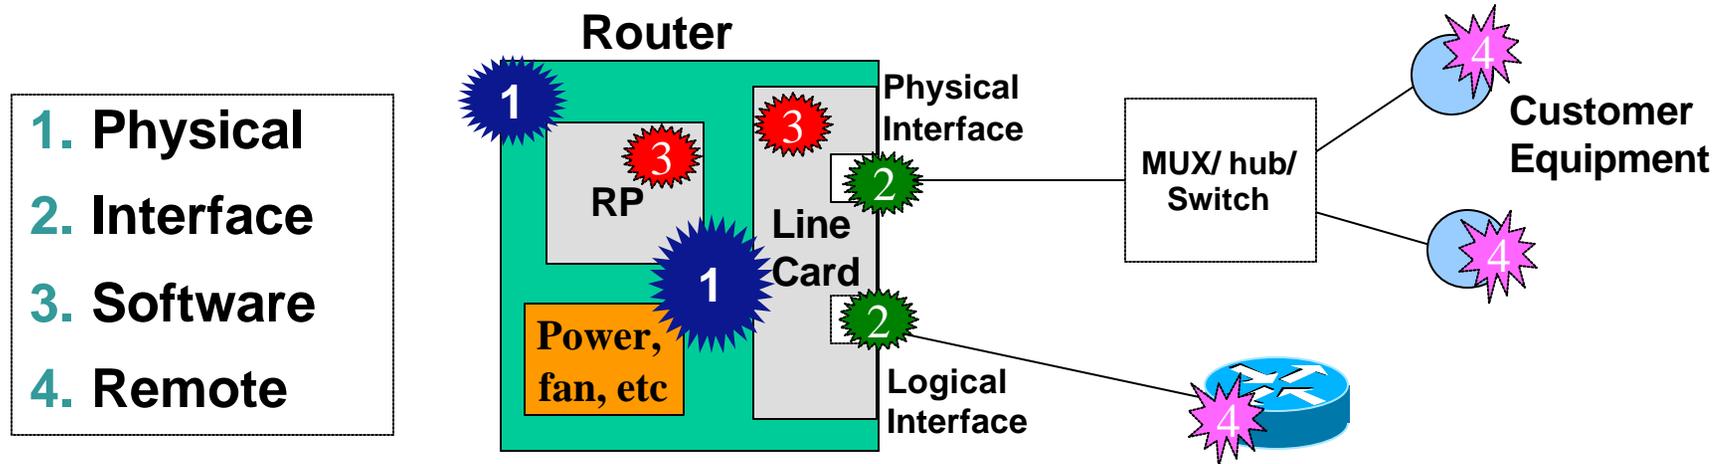

# Case Study 1: [1] Engineered Availability

- **Engineered availability based on network design, component MTBF and MTTR**
- **MTBF = Mean Time between Failure**
  - Calculated by measuring the average time between failures on a device/component
  - Vendors should provide MTBF for their network components
- **MTTR = Mean Time To Repair**
  - The time between when the device/network broke and when it was brought back into service
  - Dependant on:
    - ✓ Time taken for provider to identify and fix faults
    - ✓ Component stock and where it is located

# Case Study 1: [2]

## Engineered Availability: Possible Failures

- **Require MTBF for each component**
  - Devices consist to multiple components each with an MTBF
- **Single inline components reduce availability**
- **Parallel components improve availability**
  - Examples: Dual PSU, Processors, links to remote devices, etc

# Case Study 1: [3] Engineered Availability: Component Outage On-Line

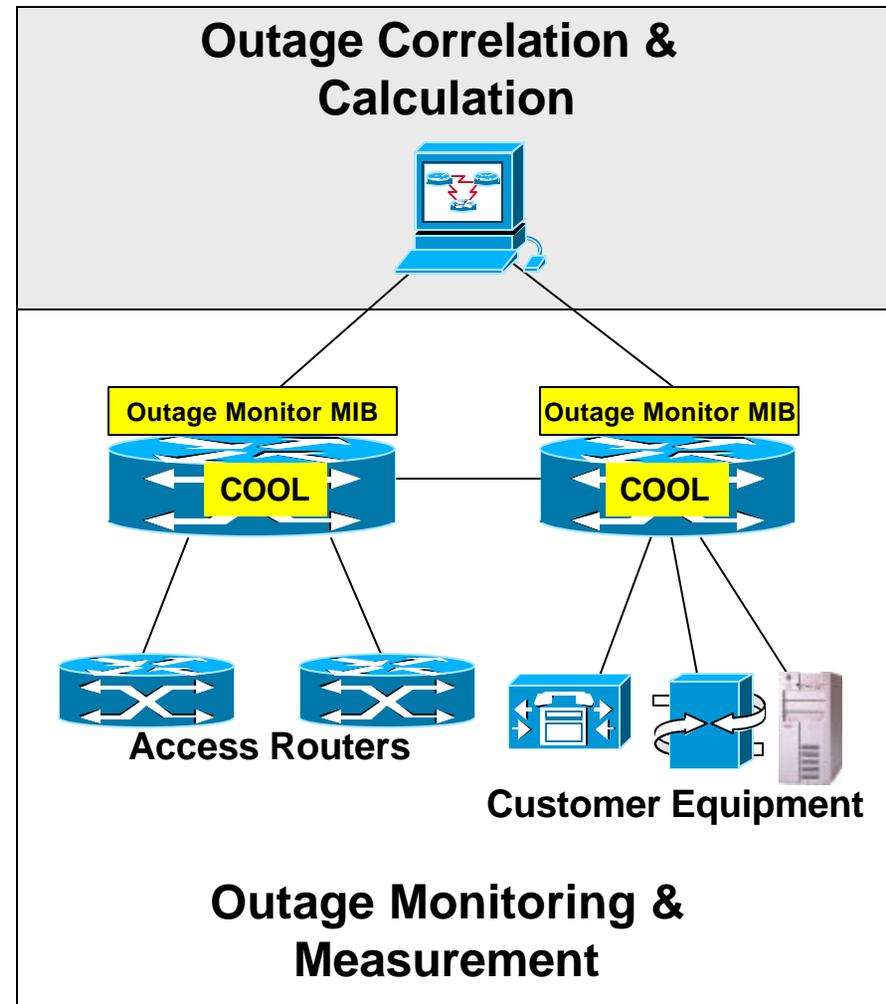

Cisco.com

## Component Outage On-Line (COOL)

On device MTBF and MTTR monitoring

- **Features**

- ✓ On-line measurement embedded in router
- ✓ Outage data stored in router
- ✓ Maintains values over reload
- ✓ Open access via CLI and CISCO-OUTAGE-MONITOR-MIB
- ✓ Event filtering

# Case Study 1: [4] Engineered Availability: COOL

## Cool Monitors:

- ✓ The device
- ✓ Interfaces Physical and Logical
- ✓ Remote devices
- ✓ Individual Processes for IOS-XR

Not Engineered Availability  
but IP connectivity

## Example Configuration

Step	Command Line	Description
1	<code>(config)# cool group-interface Ethernet</code>	Monitor all Ethernet Interfaces
2	<code>(config)# cool group-interface Serial4</code>	Monitor all interfaces containing the string Serial4
3	<code>(config)# cool remote device 1 10.10.10.1 R1-2610 60 5</code>	Monitor a remote device R1-2610  Send 5x ICMP Ping to 10.10.10.1 once every 60s
4	<code>(config)# cool run</code>	Start Cool running

# Case Study 1: [5] Engineered Availability: COOL

- 1. Type  
    Failure code
- 2. Index  
    SNMP Index
- 3. Event  
    Event code  
    0=up
- 4. Time Stamp  
    Unix Time Stamp
- 5. Interval  
    Time since last event for that object
- 6. AOT  
    Accumulated Outage Time in seconds.
- 7. NAF  
    Number of Accumulated Failures

```
R4-7507#sh cool
**** COOL Event Table ****
type index event time-stamp interval hist_id object-name

4      1      2    1114509357   183     1    R1-2610
```

**Remote device reloaded.  
183s to restore IP connectivity**

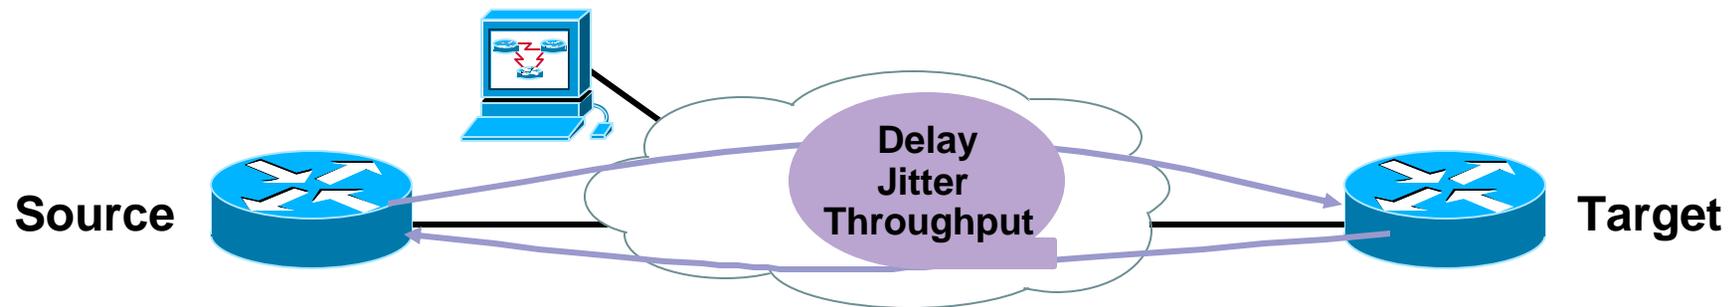

**Interface not configured**

**Device reloaded once and took 140s to reboot**

## CASE STUDY 2: Connectivity

# Case Study 2: Connectivity [1]

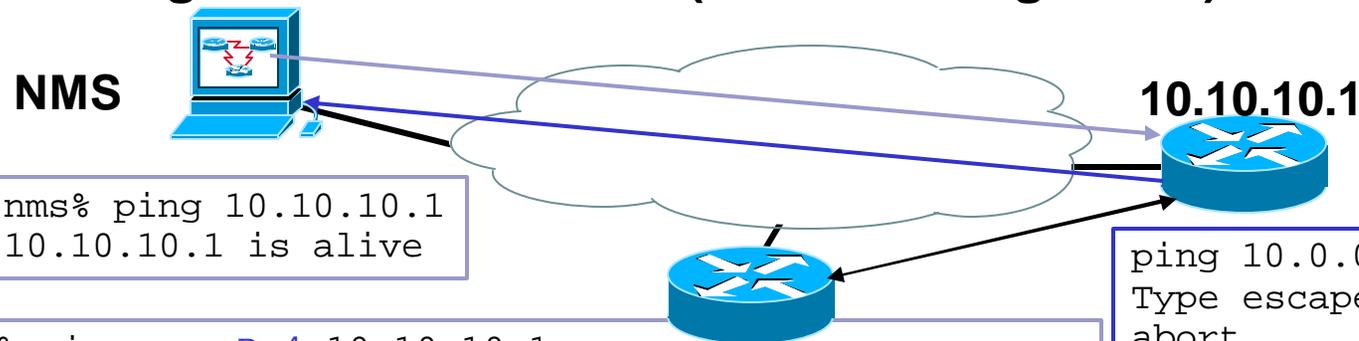

- **Availability is the metric used to determine uptime and downtime**  
$$\text{Availability} = (\text{Uptime}) / (\text{Total Time})$$
- **In terms of a Network do I have connectivity or not**
- **Examples: COOL, CLI SNMP, PingMIB, IPSLA**
- **Adding bounded metrics provides some measurement of a service**

# Case Study 2: Connectivity [2]

## ICMP PING: CLI

- Ping gives you availability details from:  
Network management station to your devices.  
Between Devices
- Ping can be QoS aware (TOS is configurable)

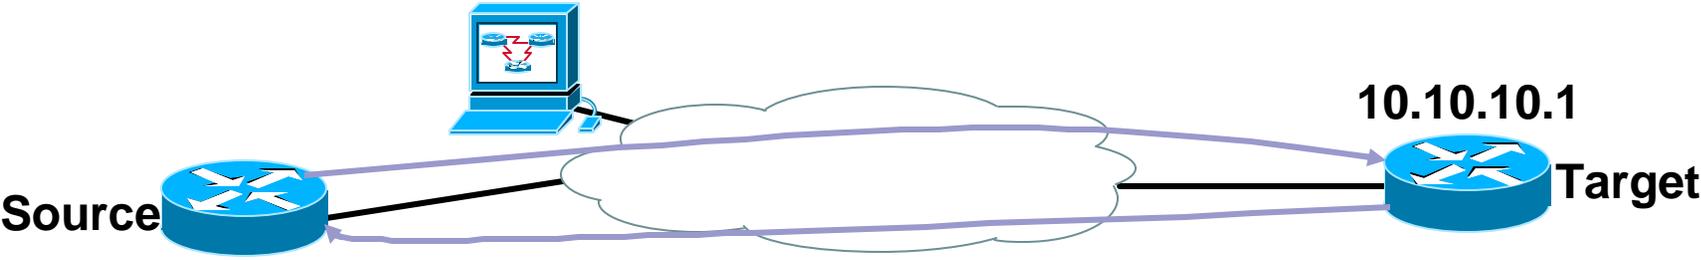

```
nms% ping 10.10.10.1
10.10.10.1 is alive
```

```
nms% ping -s -P 4 10.10.10.1
PING 10.10.10.1: 56 data bytes
64 bytes from 10.10.10.1: icmp_seq=0. time=66. ms
64 bytes from 10.10.10.1: icmp_seq=1. time=110. ms
64 bytes from 10.10.10.1: icmp_seq=2. time=71. ms
<snip>
^C
----10.10.10.1 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet
loss
round-trip (ms)  min/avg/max = 32/63/110
```

```
ping 10.0.0.1
Type escape sequence to
abort.
Sending 5, 100-byte ICMP
Echos to 10.0.0.1, timeout
is 2 seconds:
!!!!
Success rate is 100
percent (5/5), round-trip
min/avg/max = 76/97/156 ms
```

# Case Study 2: Connectivity [3]

## CISCO-Ping-MIB: SNMP

<ftp://ftp.cisco.com/pub/mibs/v2/CISCO-PING-MIB.my>

### SNMP SET

```
1: ciscoPingEntryStatus.333 (integer) CreateAndWait(5)
2: ciscoPingProtocol.333 (integer) ip(1)
3: ciscoPingAddress.333 (octet string) 0A:0A:0A:01
4: ciscoPingEntryOwner.333 (octet string) dmelton
5: ciscoPingPacketCount.333 (integer) 100
6: ciscoPingEntryStatus.333 (integer) Active(1)
```

**createAndWait(5) ping operation 333**

**1<sup>st</sup> 4 SNMP sets required and must be set in order shown**

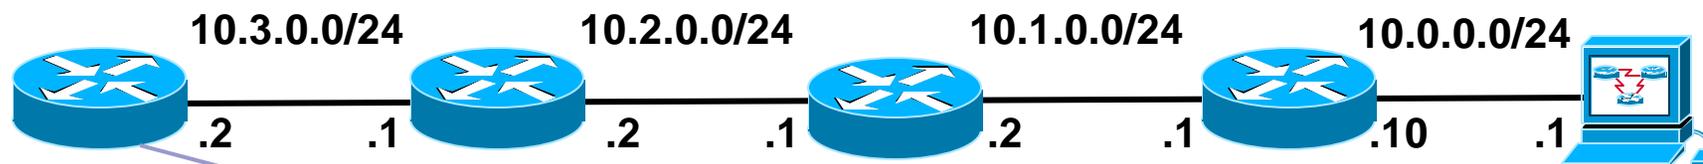

**Start probe  
Runs once  
Destroy(6) and repeat  
using CreateAndWait(5)**

### SNMP GET/WALK

```
ciscoPingSentPackets.333 (counter) 100
ciscoPingReceivedPackets.333 (counter) 100
ciscoPingMinRtt.333 (integer) 56
ciscoPingAvgRtt.333 (integer) 84
ciscoPingMaxRtt.333 (integer) 236
ciscoPingCompleted.333 (integer) true(1)
```

# Case Study 2: Connectivity [4]

## Traceroute: CLI

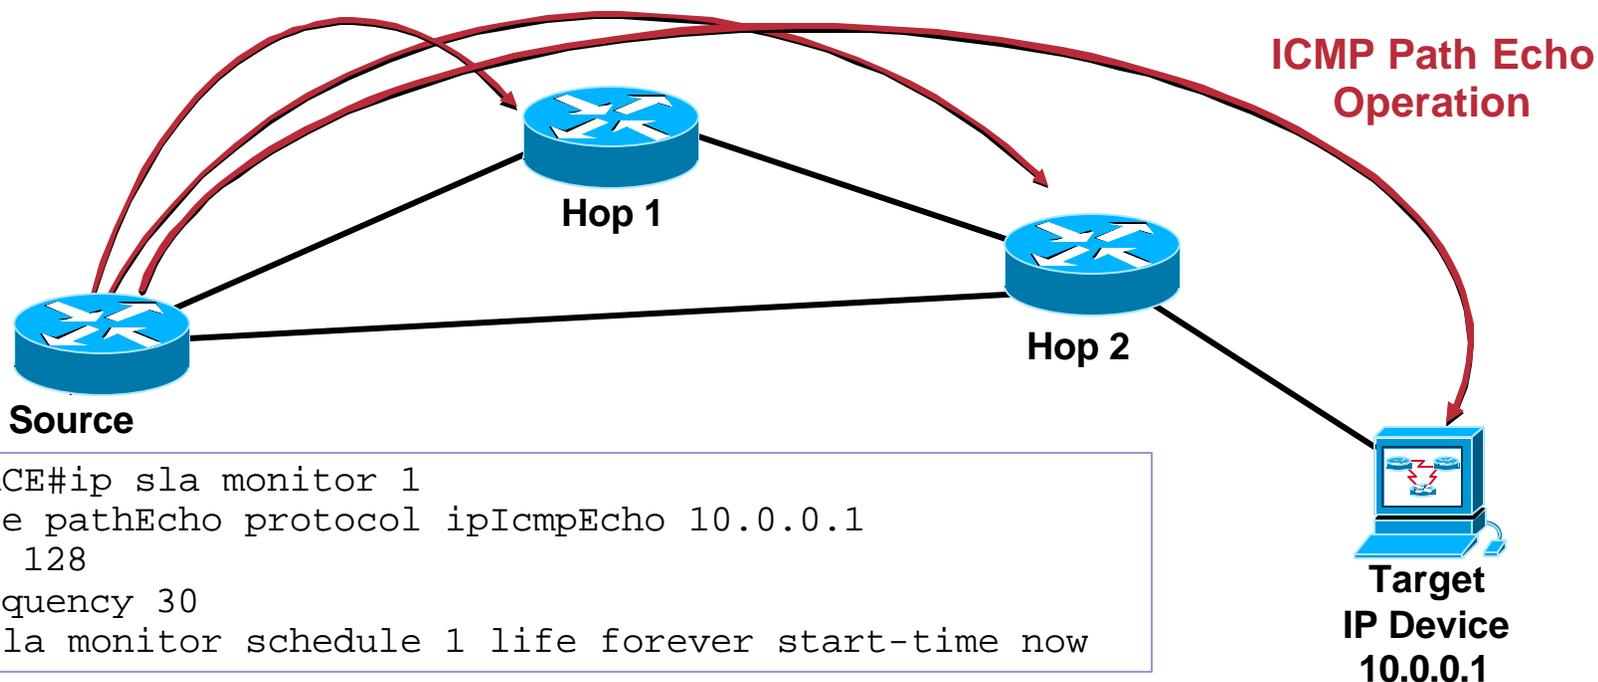

- Indicates where failures occur
- Response at each hop
- Total network response time
- Traceroute can be QoS aware

```
pag1#traceroute 10.0.0.1
Type escape sequence to abort.
Tracing the route to 10.0.0.1
 0 10.0.0.1 0 msec 0 msec 0 msec
 1 10.3.0.1 4 msec 0 msec 4 msec
 2 10.2.0.1 36 msec 77 msec 316 msec
 3 10.1.0.1 72 msec 80 msec 80 msec
 4 10.0.0.1 85 msec 72 msec 84 msec
```

```
traceroute: Warning: Multiple interfaces found; using
10.0.0.1 @ qfe0
traceroute to 10.10.10.1 (10.10.10.1), 30 hops max, 40

1 4043292 1 2 1 1 0 6 6 6
1 4043292 1 3 1 1 0 74 74 74
1 4043292 2 1 1 6 0 440 74 73
1 4043292 2 2 1 6 0 36 6 6
```

# Case Study 2: Connectivity [6] ICMP Path Echo: IPM and IPSLA

# Case Study 2: Connectivity [7]

## MPLS Network Availability

- **Basic IP Ping concepts have been extended to other technologies**
  - **IP Ping does not detect MPLS network failures**
- **Ping within a VRF**
  - **Used By Service Providers to check customer VPN connectivity from within the Service Provider network**
- **MPLS Aware Ping**
  - **LSP-PING detects MPLS failures and provides diagnostics**
  - **Also works for Traffic Engineering and Pseudowires**
  - **All devices along the Path must support LSP-ping**

# CASE STUDY 3: VoIP Quality

# Case Study 3: VoIP Quality [1]

## Where do we Measure ?

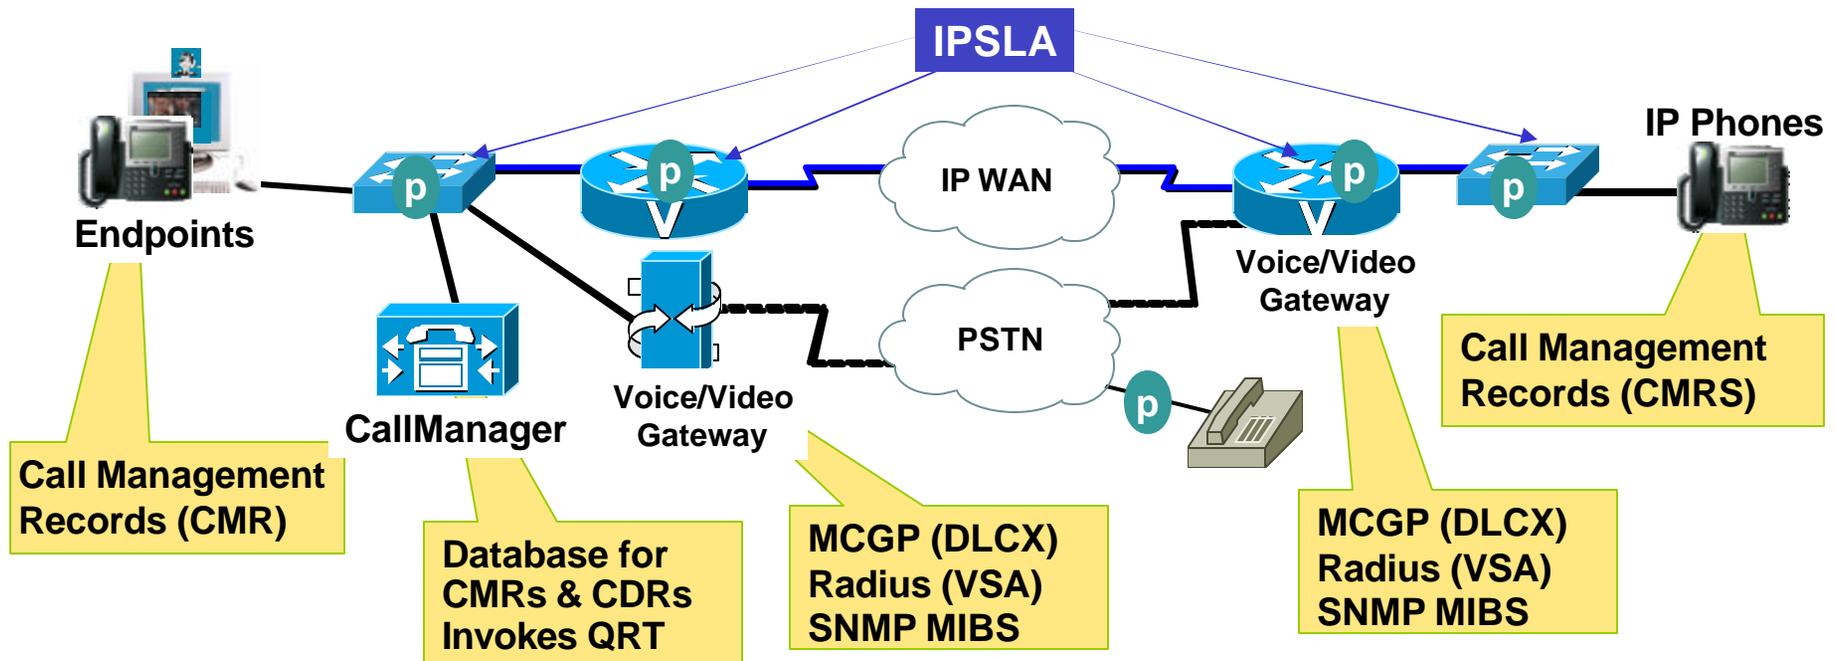

- Identify the points where Voice Quality Statistics is provided

As near to the end points (IP Phones) as possible

Embedded Passive Monitoring is preferred

Active Monitoring provides continuous monitoring

Embedded/External Probes for mid point analysis

# Case Study 3: VoIP Quality [2]

## Basic Voice Quality Metrics

- **MOS**

**Mean Opinion Score**

**Subjective voice quality measurement**

- **R-factor**

**Transmission Rating Factor**

**Estimates voice quality by calculating sum of impairments along voice path**

- **ICPIF**

**Calculated Planning Impairment Factor**

**Outdated by R-factor**

**Cisco voice gateways and IPSLA uses ICPIF**

Quality	User Satisfaction	MOS	ICPIF	R-Factor
Best	Very Satisfied	5	0 - 3	-
High	Satisfied	4	4 - 13	100 - 80
Medium	Some users dissatisfied	3	14 - 23	59 - 79
Low	Many users dissatisfied	2	24 - 33	39 - 58
Poor	Nearly all users dissatisfied	1	34 - 43	0 - 38

**Note: R-Factor of 100 gives MOS 4.5**

# Case Study 3: VoIP Quality [3]

## IP Phone Statistics

- IP Phone Call Statistics

- ✓ packets/bytes sent
- ✓ Packets lost
- ✓ Jitter

- Statistics for each end of the call

End-to-end statistics requires an IP phone at both ends of the call

- Sent to Call Manager at end of call

This can average out Voice Quality issue in the reports

Cisco Systems, Inc. - Microsoft Internet Explorer provided by Cisco Systems, Inc.

# Case Study 3: VoIP Quality [4] Call Manager Statistics: CMR reporting

Cisco.com

User Reports System Reports Device Reports CDR Search System Report Config Hel

## CDR Analysis and Reporting

For Cisco IP Telephony Solutions

### QoS Summary

Available Reports\*

Select Call Types\*  On Net  Internal  Local  Long Distance  
 International  Incoming  Tandem  Others

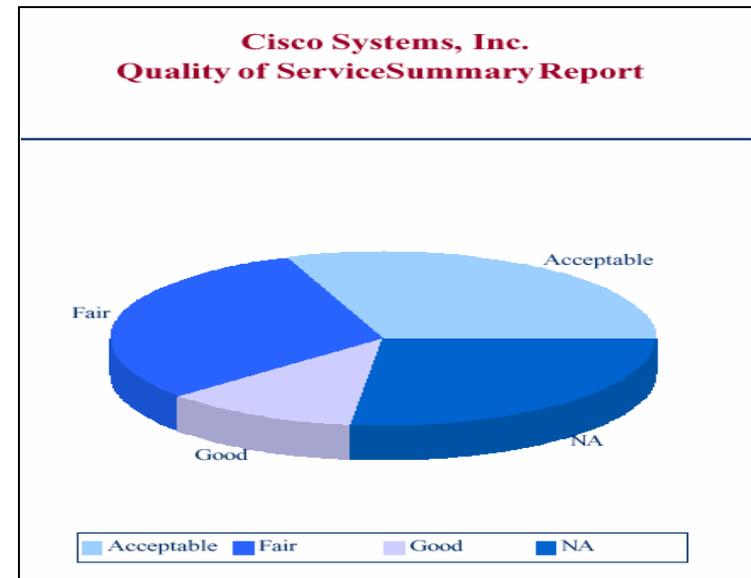

From Date\*

To Date\*

Report Format\*  CSV  PDF

Status: Ready

\* indicates required item

- Call Management records CMR from IP phone at end of Call
- Administrator defines thresholds for Call Quality Categories
- Call Detail Records (CDR) generated at end of call.

# Case Study 3: VoIP Quality [5]

## Call Manager Statistics: QRT

### Quality Report Tool (QRT)

- **User Presses QRT key to log issues**

**9 Possible options (Echo, Choppy sound, Robotic sound, Long delays, Low volume, Can't hear other end).**

**If Call is in process, QRT logs on to User IP phone (HTTP) and collects CMR statistics.**

**QRT polls phone at 30-3600s (30s default).**

**Data is recorded in log file not CMR reports.**

**[ccmQualityReport](#) - This Notification is sent when a user reports a quality problem using the Quality Report Tool**

# Case Study 3: VoIP Quality [6]

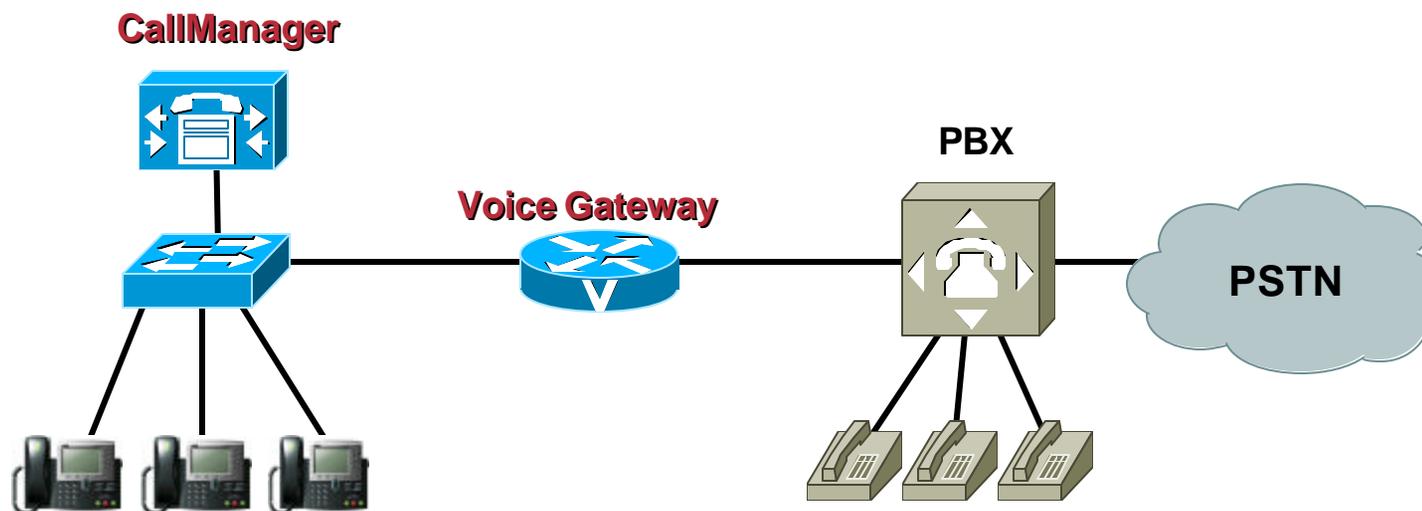

## Voice Gateway Statistics

### Most useful Voice Gateway Statistics

- **PlayoutDelay (Minimum, Maximum, Average)**  
A measure of jitter on the packets received by the gateway.
- **Gap Fill with Prediction/Silence**  
Total duration of packets lost during the call.
- **Round Trip Delay (RTD)**  
The delay between the gateway and its peer.  
Uses RTCP so only works with a gateway on both ends of the RTP stream.
- **Calculated Planning Impairment factor (ICPIF)**  
Single metric for VoIP Quality. Mean Opinion Score (MOS) is more widely used

# Case Study 3: VoIP Quality [7]

## Voice Gateway Statistics

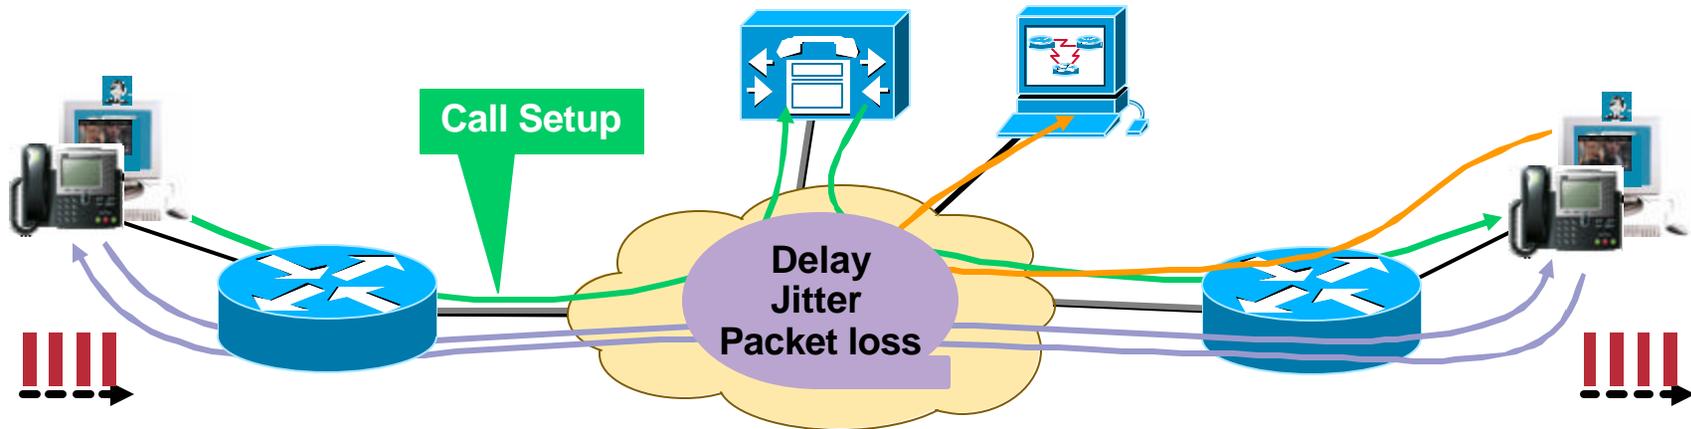

- **Voice Quality Information is exported from Gateway:**
  - MGCP: Delete Connection (DLCX) message at the end of the call.**
  - SIP, H.232: Radius server in the Vendor Specific Attributes (VSA), at the end of the call**
  - SNMP Polled: Cisco-Voice-Dial-Control-MIB**

# CASE STUDY 4: Services

# Case Study 4: Services [1]

- **Monitoring VoIP is not just about Monitoring VoIP Quality**
  - Availability of Voice Services
  - Quality of VoIP over network infrastructure
- **Networks carry many other services**
  - May tolerate some degree of jitter, delay & packet loss
  - Examples; WEB services, file transfers

# Case Study 4: Services [6] IPSLA Operations

# Case Study 3.2.2: Services [7]

## IPSLA: VoIP

**Standard jitter,  
Packet loss,  
latency  
measurements**

```
(config)#type jitter dest-ipaddr 10.10.10.1  
dest-port 5555 num-packets 100
```

**Complex output difficult to estimate VoIP quality**

**Voice quality  
score  
measurements**

```
(config)#type jitter dest-ipaddr  
10.10.10.1 dest-port 5555 codec ?  
g711alaw G.711 A Law 64000 bps  
g711ulaw G.711 U Law 64000 bps  
g729a G.729 8000 bps
```

**MOS + ICPIF, based on delay and packet loss,  
provide direct measure of VoIP Quality**

**Call setup  
measurements**

```
(config)#type voip delay gatekeeper registration
```

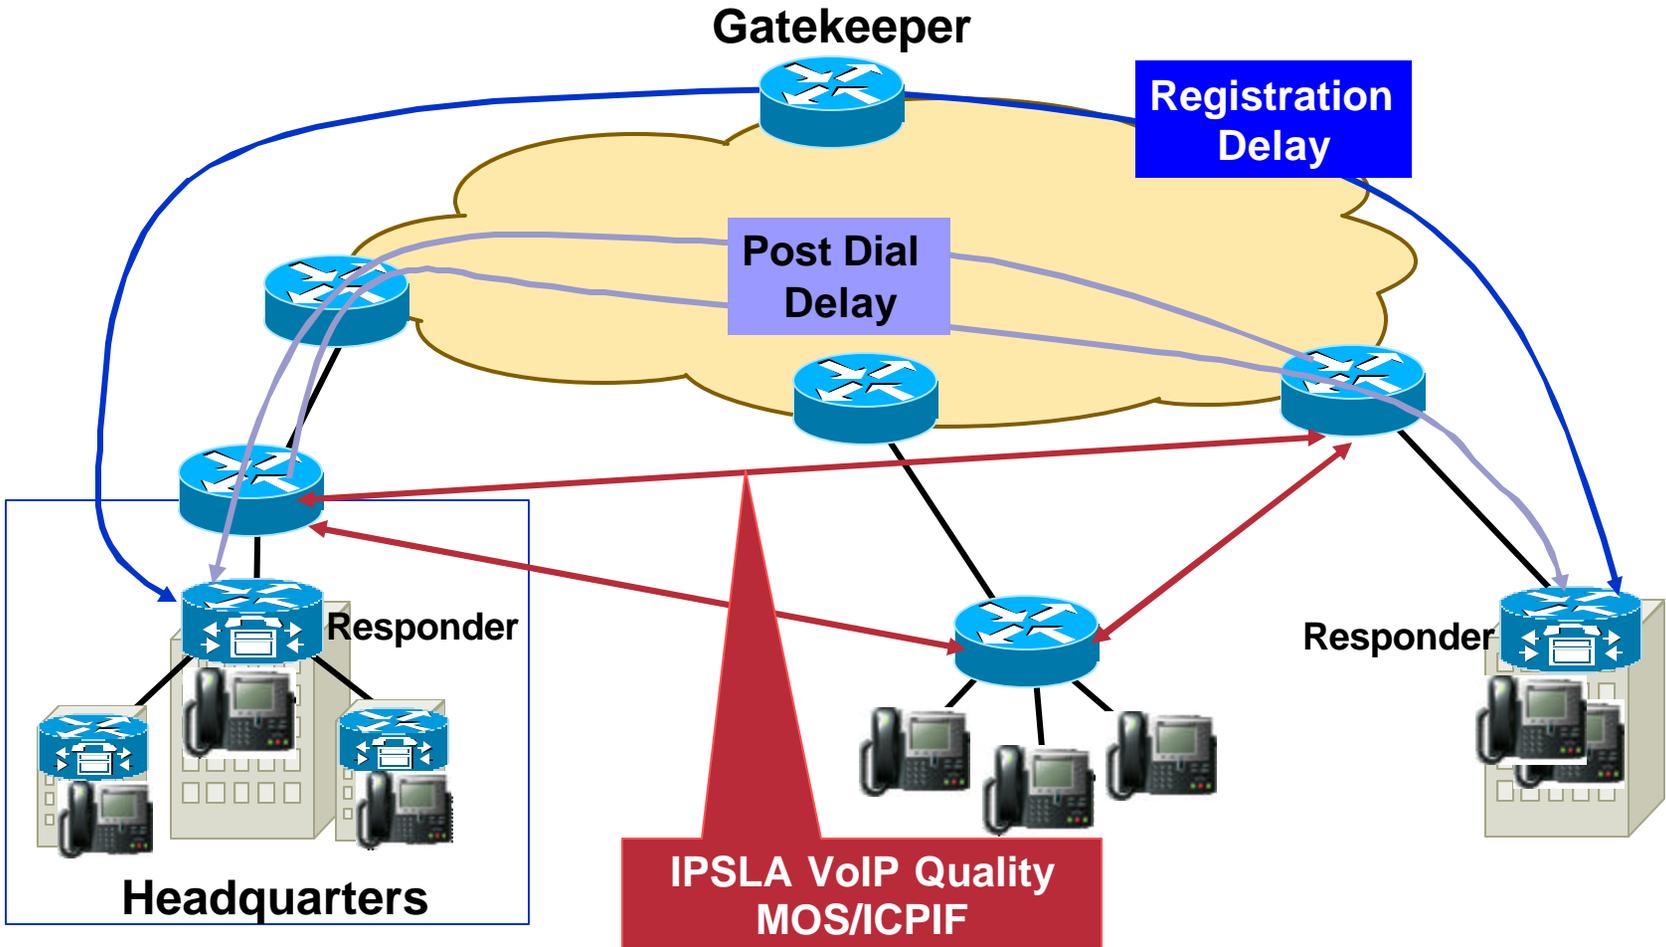

**Enabled on Gatekeeper**

```
(config)#type voip delay post-dial  
destination 449614
```

**Response of test calls to voice end point**

# Case Study 4: Services [8]

## IPSLA: VoIP 12.3(14)T

# Case Study 4: Service [9] IPSLA: VoIP 12.3(14)T

- **Simulating G.711 A-Law codec (64 kbps transmission) VoIP Call**

```
(config)#
  ip sla monitor 10
    type jitter dest-ipaddr 10.10.10.4 dest-port 16384 codec
g711alaw advantage-factor 2
    owner admin
    tag jitter-with-voice-scores
  ip sla monitor schedule 10 start-time now
  ip sla monitor reaction-configuration 10 react mos
threshold-type immediate threshold-value 490 250 action-type
trapOnly
  ip sla monitor logging traps
  snmp-server host 10.10.10.10 version 2c public
  snmp-server enable traps syslog
```

set default values for:  
codec-numpackets, codec-size,  
& codec-interval

Translates IP SLA syslog in to Traps

connectionLoss,  
jitterAvg,  
jitterDSAvg,  
jitterSDAvg,  
Mos,  
PacketLossDS,  
PacketLossSD  
Rtt,  
Timeout,  
verifyError

0: Wire/land-line  
5: Mobility in building  
10: Mobility in Geographical area  
20: Hard to reach location

**Note: Logging Commands Are Needed  
Only if You Want to Send the Syslog  
Message to a Logging Server**

# Case Study 4: Services [11]

## IPSLA: Monitoring Other Services

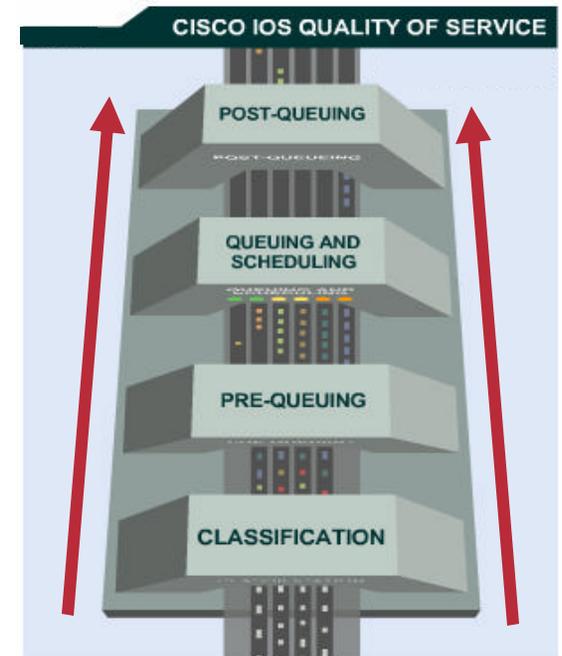

# CASE STUDY 5: QoS

# Case Study 5: QoS [1]

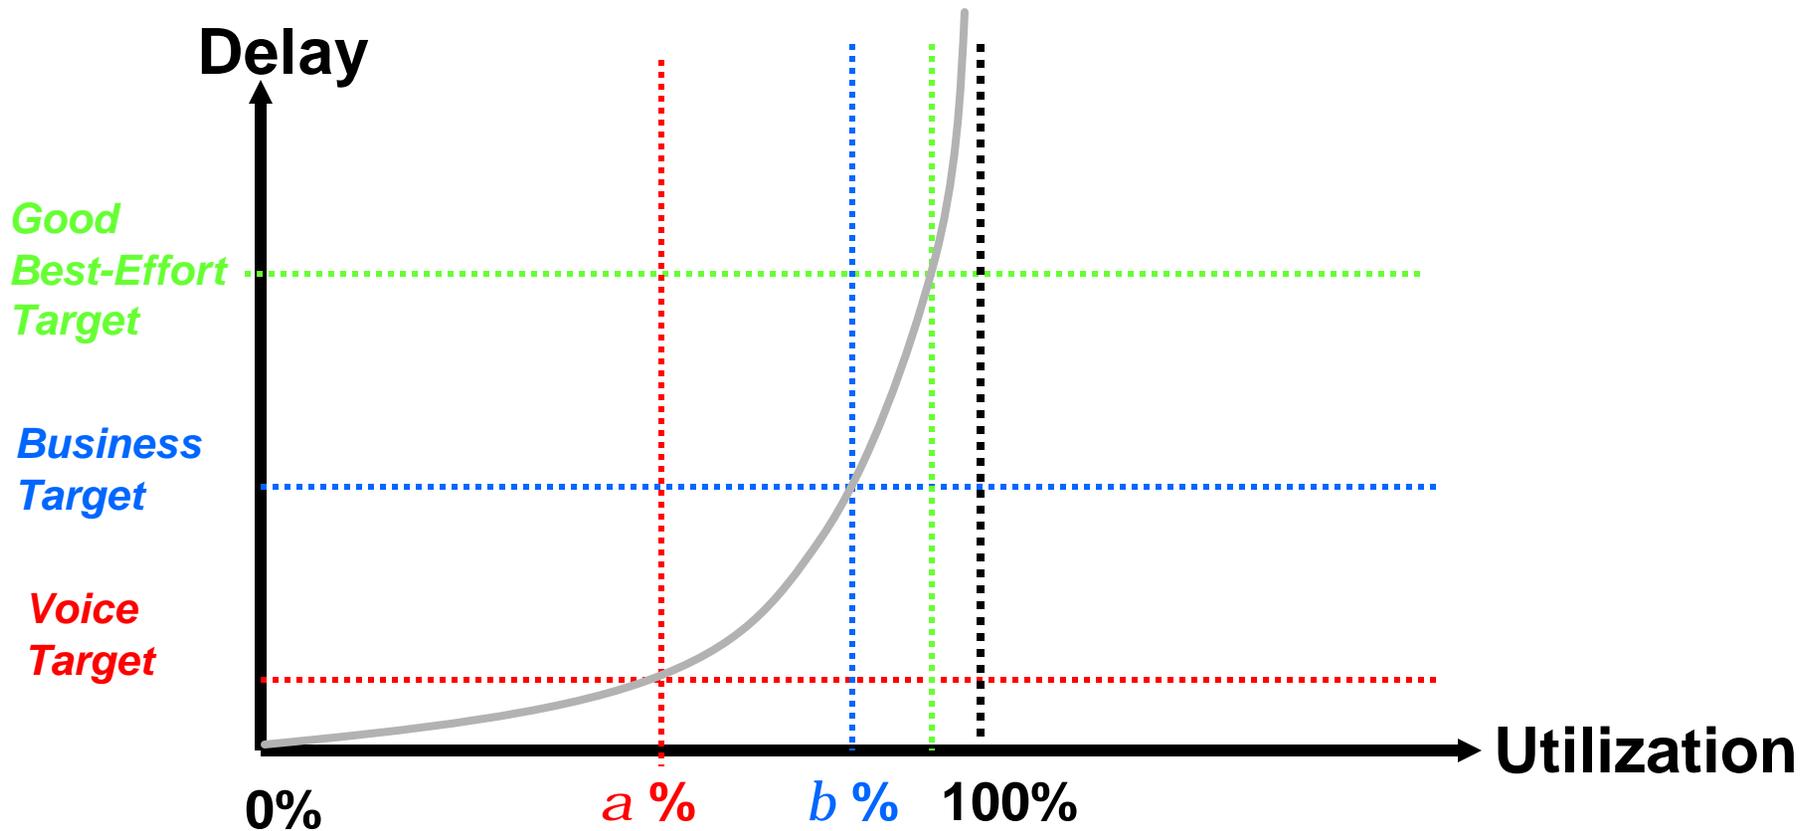

## When is QoS Used?

- If bandwidth is abundantly, economically, and reliably available, there is no need for QoS
- Otherwise, QoS mechanisms are:
  - Essential for real-time applications**
    - Two way, interactive: voice, videoconferencing
    - One way, streaming: movies, lectures
  - Important for high priority data applications**
    - Response-time sensitive: interactive, transactional
  - Less important for “bulk” data applications – except when assigned to lower priority**
    - “Elastic” applications: will wait and use data whenever packets arrive
  - Helpful to limit undesired traffic**
    - Peer-to-peer file sharing in some networks

# Case Study 5: QoS [2]

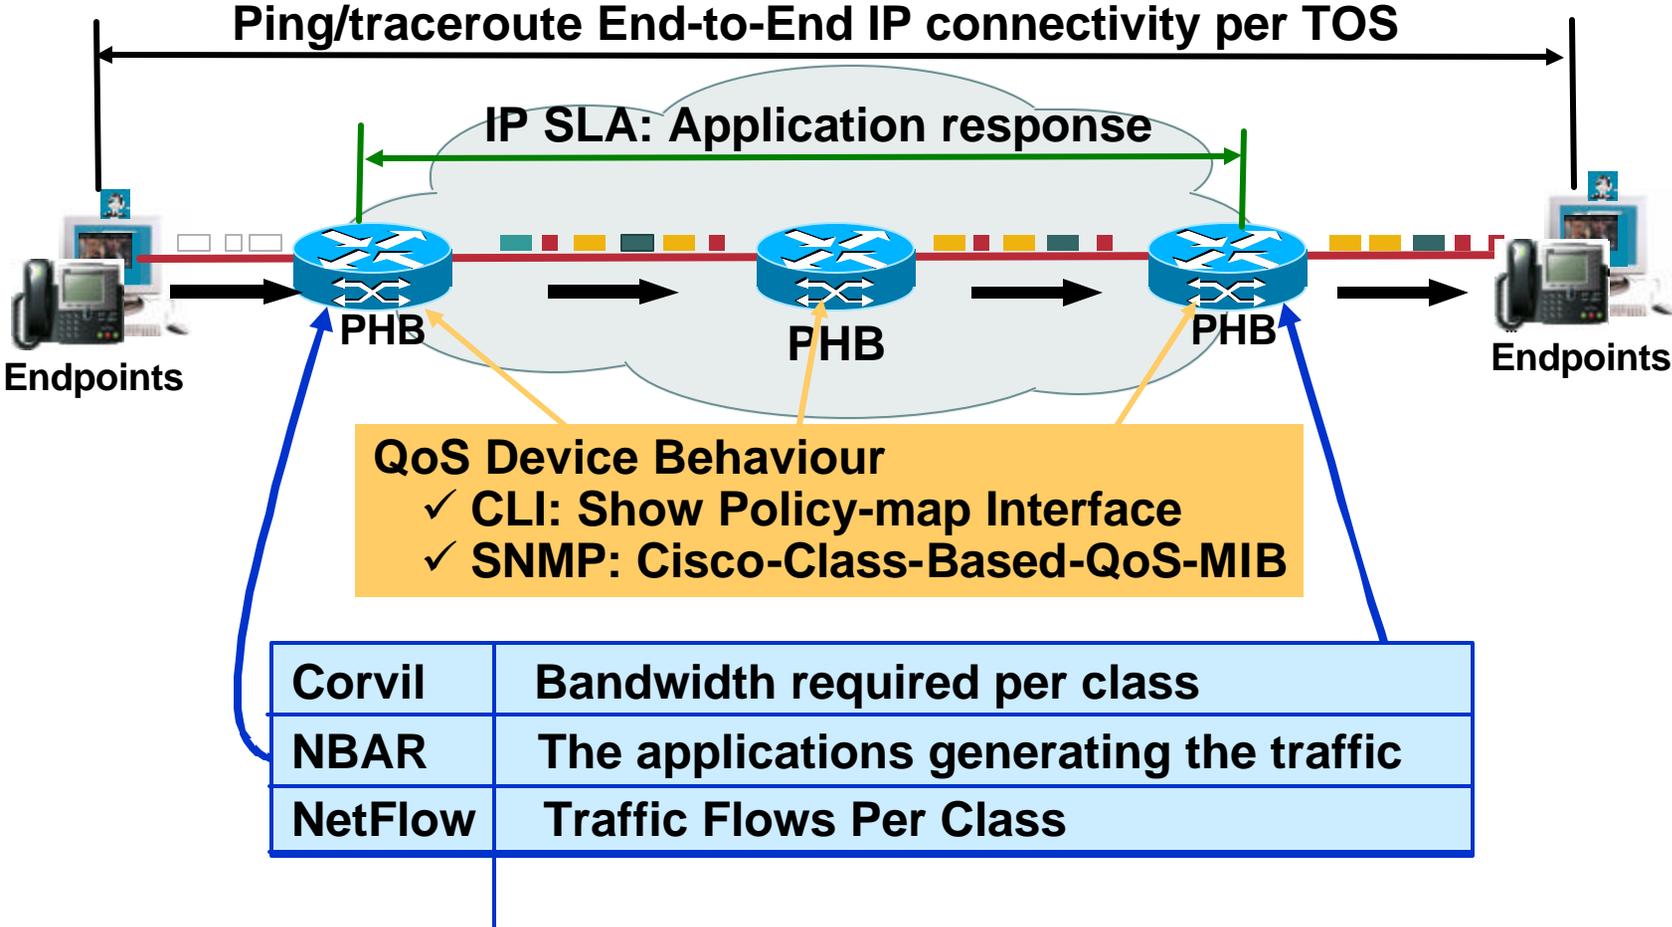

## Managed Unfairness

If I can keep **Voice traffic**  $< a\%$  , I will keep **Voice delay** under  $M1$  ms  
If I can keep **Business traffic**  $< b\%$  , I will keep **Business delay** under  $M2$  ms

# Case Study 5: QoS [3]

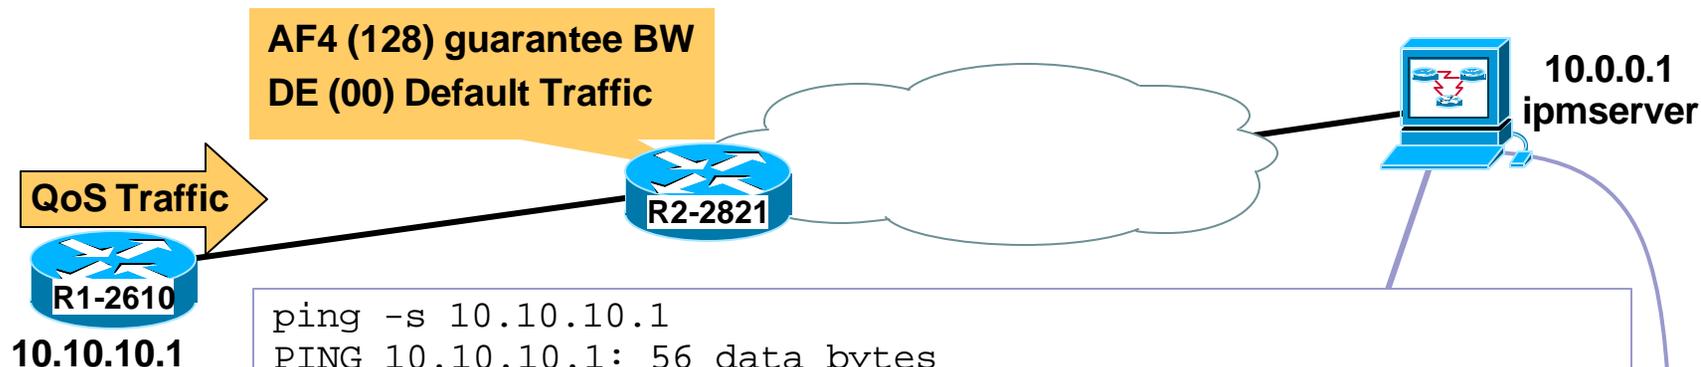

## QoS Monitoring Tools

**Note: PHB Per-hop behaviour**

# Case Study 5: QoS [4]

## CLI Ping

```
ping -s 10.10.10.1
PING 10.10.10.1: 56 data bytes
64 bytes from 10.10.10.1: icmp_seq=0. time=159. ms
64 bytes from 10.10.10.1: icmp_seq=1. time=205. ms
<snip>
----10.10.10.1 PING Statistics----
7 packets transmitted, 7 packets received, 0% packet loss
round-trip (ms)  min/avg/max = 40/92/205
```

**Ping in Class AF4  
improves response**

**Traceroute in class  
DE identifies hop  
causing increased  
delay**

```
# ping -s -c 128 10.10.10.1
PING 10.10.10.1: 56 data bytes
64 bytes from 10.10.10.1: icmp_seq=0. time=19. ms
64 bytes from 10.10.10.1: icmp_seq=1. time=22. ms
<snip>
----10.10.10.1 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms)  min/avg/max = 19/47/183
```

# Case Study 5: QoS [5]

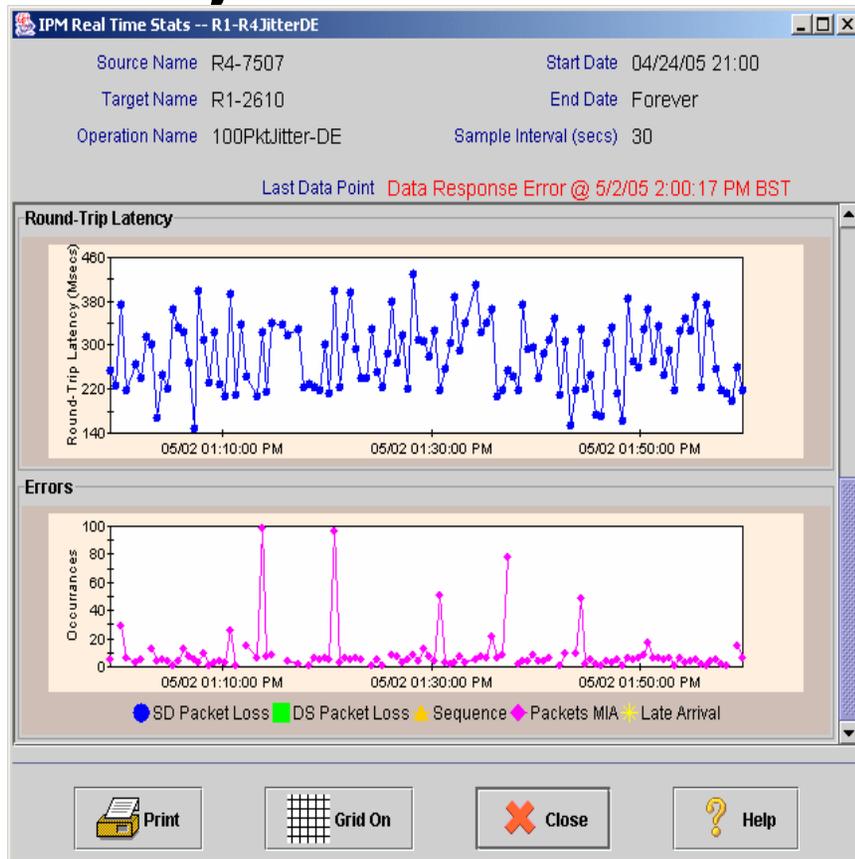

## IPSLA and QoS

- **If you have the right probe type to match the service use it**  
Examples: Telnet, HTTP, FTP, DNS
- **Overall network quality should be measured using IP SLA jitter probes because:**
  - A Sequence packets is sent per operation so more likely to be impacted by QoS
  - Provides best response measurements including:
    - ✓ **Jitter: Source->Destination, Destination->Source**
    - ✓ **Packet Loss: Source->Destination, Destination->Source**
    - ✓ **Round trip and one-way delay.**

```
R2-2821(config)#ip sla monitor 1
R2-2821(config-sla-monitor)#type jitter dest-ipaddr 10.10.10.4
                                dest-port 4444
R2-2821(config-sla-monitor-jitter)#tos ?
                                <0-255>  Type of Service Value
R2-2821(config-sla-monitor-jitter)#tos 128
```

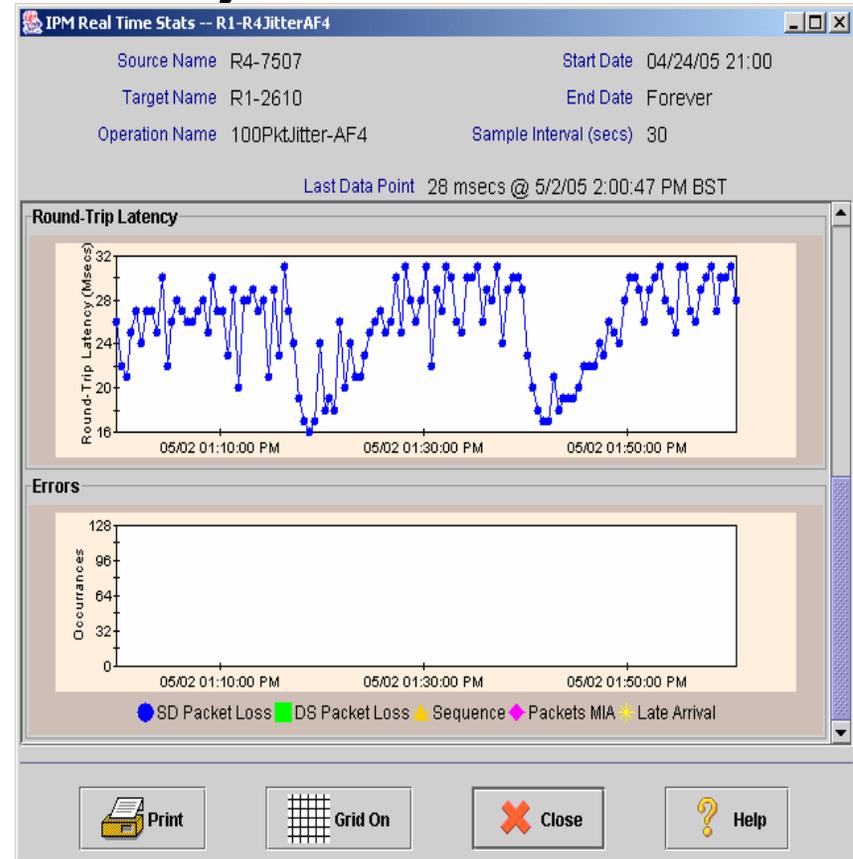

# Case Study 5: QoS [6] IPSLA & IPM

## IP SLA jitter DE

**Response 200-400ms**  
**Excessive Packet Loss**

## IP SLA jitter AF4

**Response 20-30ms**  
**No Packet Loss**

# Case Study 5: QoS [7]

## CLI: Show Policy-map

### Show policy map-interface

- All QoS on the device
- There can be a lot of output

```
R2-2821#show policy-map interface serial 0/2/1
Serial0/2/1

Service-policy : inner_toPE
  Class-map: ef_toPE (match-any)
    67182 packets, 6559656 bytes
    30 second offered rate 0 bps, drop rate 0 bps
  Match: ip dscp ef (46)
    67182 packets, 6559656 bytes
    30 second rate 0 bps
  Queueing
    Strict Priority
    Output Queue: Conversation 24
    Bandwidth 50 (kbps) Burst 1250 (Bytes)
    (pkts matched/bytes matched) 28136/1352768
    (total drops/bytes drops) 294/18400
  police:
    cir 50000 bps, bc 1562 bytes
    conformed 57467 packets, 4829248 bytes;
    actions: transmit
    exceeded 8091 packets, 1645920 bytes;
    actions: drop
    conformed 0 bps, exceed 0 bps
```

```
Class-map: af4_toPE (match-any)
  716176 packets, 29235196 bytes
  30 second offered rate 8000 bps, drop rate 0 bps
  Match: ip dscp cs4 (32) af41 (34)
    715982 packets, 29219676 bytes
    30 second rate 8000 bps
  Match: ip dscp af42 (36) af43 (38)
    0 packets, 0 bytes
    30 second rate 0 bps
  Match: protocol ntp
    194 packets, 15520 bytes
    30 second rate 0 bps
  Queueing
    Output Queue: Conversation 25
    Bandwidth 100 (kbps) Max Threshold 64 (packets)
    (pkts matched/bytes matched) 495810/23671304
    (depth/total drops/no-buffer drops) 0/0/0

Class-map: class-default (match-any)
  24515193 packets, 654530939 bytes
  30 second offered rate 380000 bps, drop rate 190000 bps
  Match: any
```

# Case Study 5: QoS [8]

## CLI: Show Policy-map

- **How the device treats QoS**

**Statistics for all QoS enable objects**

- **clear counters interface**

**Resets QoS statistics**

- **Configure Interface load-interval to 30s**

**More responsive output**

**Check offered rates**

```
Class-map: af4_toPE (match-any)
 716176 packets, 29235196 bytes
 30 second offered rate 8000 bps, drop rate 0 bps
Match: ip dscp cs4 (32) af41 (34)
 715982 packets, 29219676 bytes
 30 second rate 8000 bps
Match: ip dscp af42 (36) af43 (38)
 0 packets, 0 bytes
 30 second rate 0 bps
Match: protocol ntp
 194 packets, 15520 bytes
 30 second rate 0 bps
Queueing
Output Queue: Conversation 25
Bandwidth 100 (kbps) Max Threshold 64 (packets)
(pkts matched/bytes matched) 495810/23671304
(depth/total drops/no-buffer drops) 0/0/0
```

**Traffic in AF4 will have a good service**

**Traffic in DE will not have a good service**

```
Class-map: class-default (match-any)
24515193 packets, 654530939 bytes
 30 second offered rate 380000 bps, drop rate 190000 bps
```

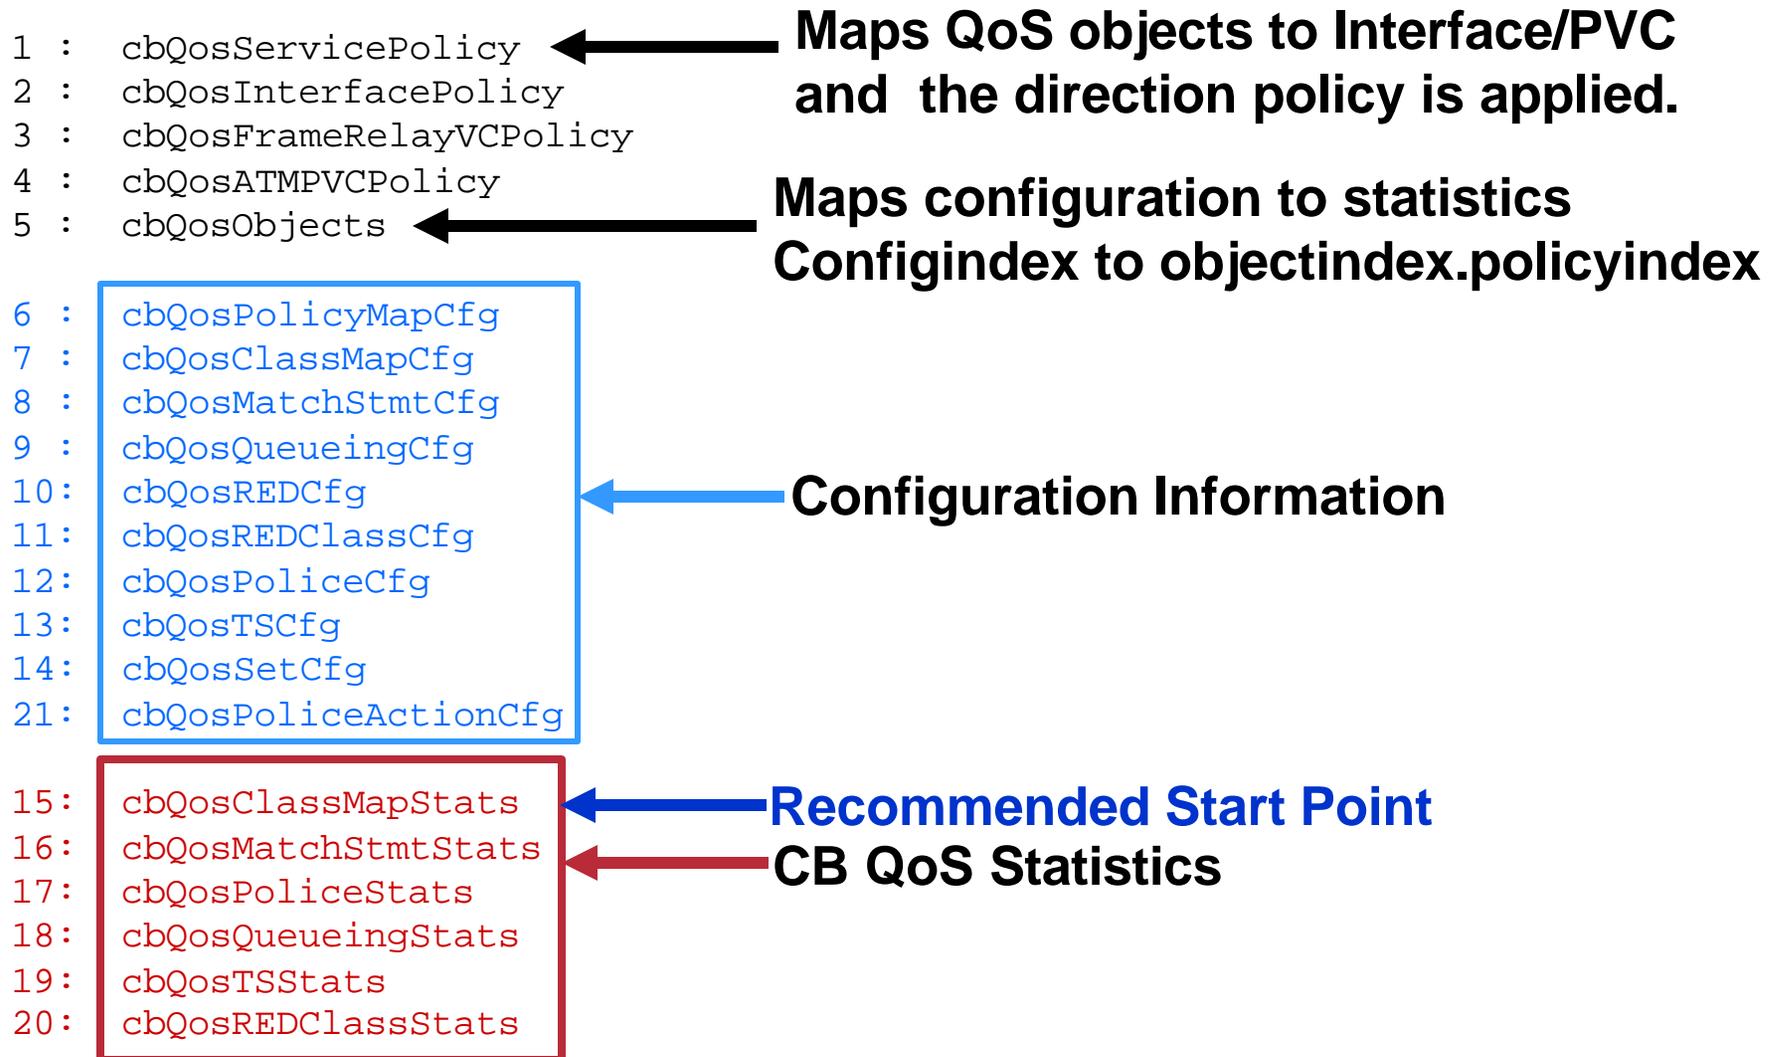

# Case Study 5: QoS [9]

## Cisco-Class-Based-QoS-MIB

- **Primary accounting mechanism for QoS:**
  - ✓ **Policing**
  - ✓ **Classification**
  - ✓ **Shaping**
  - ✓ **Queuing**
  - ✓ **Congestion Avoidance**
- **Long term QoS Monitoring**  
NMS Partners: Concord, InfoVista, Quallaby, Cisco Info Centre, Cisco Info Centre, Cisco QoS Policy Manager
- **Only accounts on configured QoS behaviour**  
Does not inspect packets for TOS/DSCP
- **Provides equivalent statistics to “Show policy-map interface”**  
Counters can not be reset.
- **Navigation is Complex**

# Case Study 5: QoS [10]

## Cisco-Class-Based-QoS-MIB

# Case Study 5: QoS [11]

## CBQoS MIB: Quick Navigation

1. Show Service policy interface
2. Record: Service Policy, Class map & offered rate
3. SNMP Walk Classmap Table PrePolicyBitrate

```
Service-policy output: outer_toPE
Class-map: class-default (match-any)
30 second offered rate 401000
bps, drop rate 201000 bps
```

```
Service-policy : inner_toPE
Class-map: ef_toPE (match-any)
18544 packets, 593408 bytes
30 second offered rate 5000 bps,
drop rate 0 bps
```

```
Class-map: af4_toPE (match-any)
79836 packets, 3248112 bytes
30 second offered rate 8000 bps,
drop rate 0 bps
```

```
Class-map: class-default
(match-any)
4472619 packets, 114998532 bytes
30 second offered rate 386000
bps, drop rate 201000 bps
```

cbQosCMPrePolicyBitRate.1103.1107	5000	EF
cbQosCMPrePolicyBitRate.1103.1117	8000	AF4
cbQosCMPrePolicyBitRate.1103.1131	386000	DE in
cbQosCMPrePolicyBitRate.1103.1137	401000	DE Out

4. Compare CBQoS PrePolicybit rates to Show Policy Int offered rate
5. Assumes QoS traffic is applied to the device

# Case Study 5: QoS [12]

## CBQoSMB: Performance Monitoring

- **Historical Analysis**

Pre QoS Policy Statistics:  
**cbQosCMPrePolicyByte64**

Post Policy Statistics:  
**cbQosCMPostPolicyByte64**

$$\frac{\text{Delta (Pre Policy Bytes - Post Policy Bytes)} \times 8}{\text{Delta(sysuptime)}}$$

- **Troubleshooting**

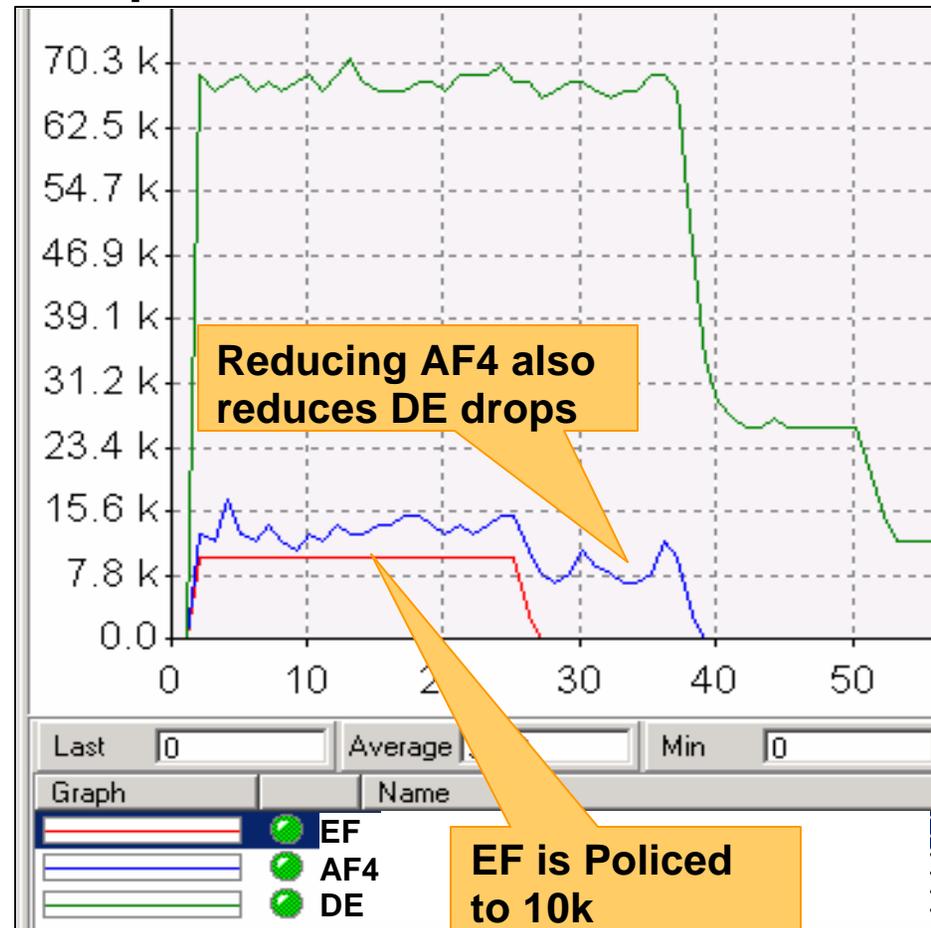

Dropped Bytes/Packets:  
**cbQosCMDropBitRate**

- **Indexes not yet persistent over reboot**

- **Partners**

Concord, InfoVista, Quallaby  
Cisco QPM, MRTG

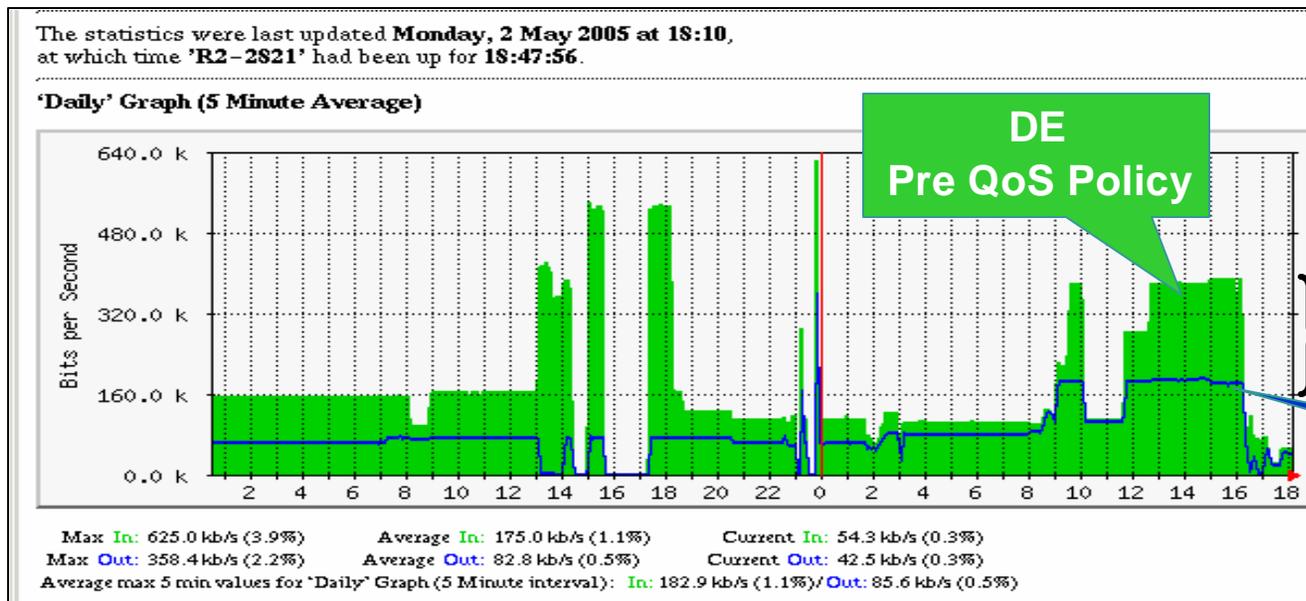

### DropBitRate for EF, AF4 & DE

# Case Study 5: QoS [13]

## Corvil Bandwidth

- We know that we are dropping traffic
- How can we calculate how much bandwidth we need:  
    To deliver against a defined SLA  
    Per Class of Service

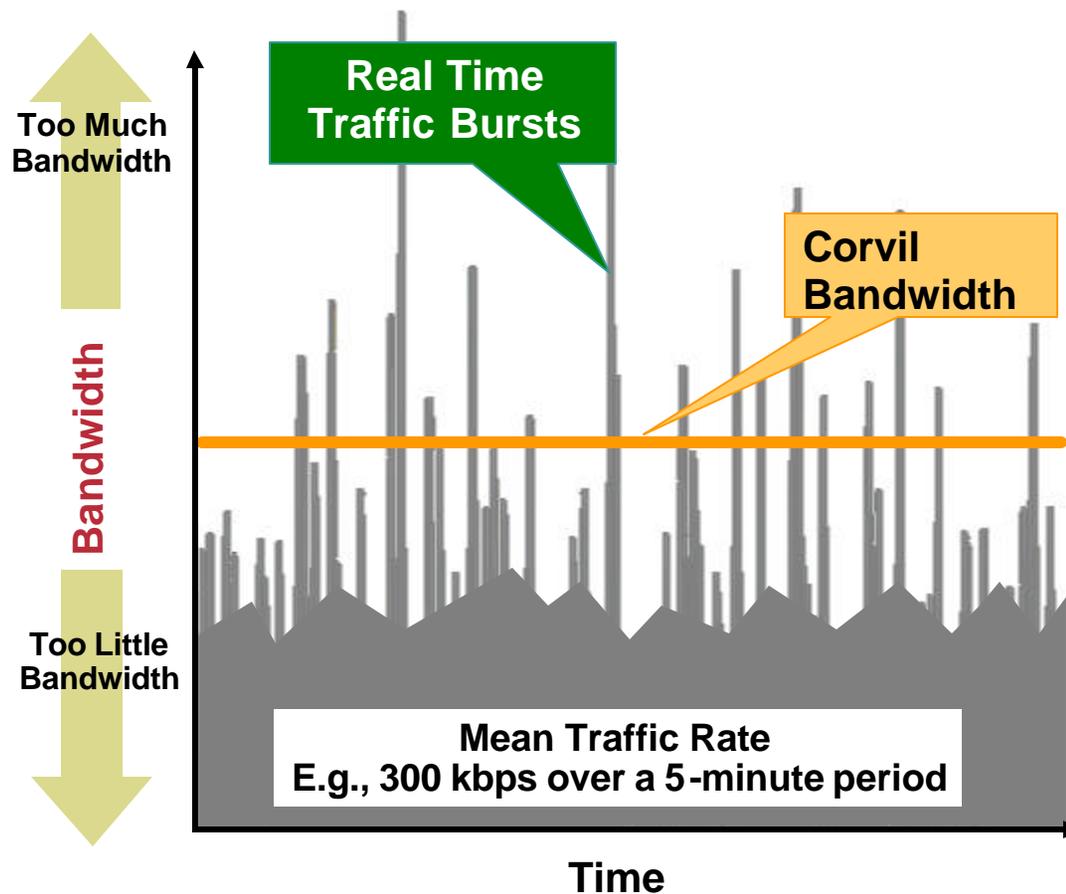

DE needs more bandwidth

DE  
Post QoS Policy

# Case Study 5: QoS [14]

## Corvil Bandwidth

- Adequate bandwidth is essential for application performance
  - Too little bandwidth can make business services unusable
  - Too much bandwidth can be very costly
- Corvil Bandwidth provides the minimum bandwidth required to meet a Quality of Service target
  - Based on 8ms measurement within a traffic class.

# Case Study 5: QoS [15]

## Corvil Bandwidth: Configuration

- **Commence observation for a traffic class**
  - Use **estimate bandwidth** command in an MQC policy map
  - Specify tolerance for **packet loss**
  - Specify tolerance for **delay duration**

```
Policy-map inner_toPE
  class class-default
    R2-2821(config-pmap-c)#estimate bandwidth drop-one-in 50
                                delay-one-in 50 milliseconds 100
```

- ✓ **Allows 1 packet in 50 to be dropped packet loss <2.00%**
  - ✓ **Allows 1 packet in 50 to be delayed by 100ms**
- **Can only be applied on outbound policies**
  - **Monitoring is via CLI or SNMP**

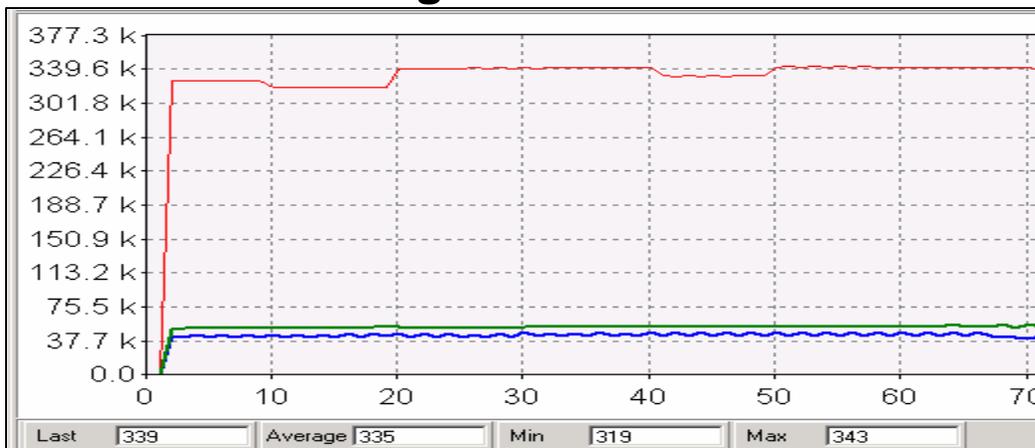

# Case Study 5: QoS [16]

## Corvil Bandwidth: Monitoring

### CLI: Show policy-map interface

```
Class-map: class-default (match-any)
  13970096 packets, 366991592 bytes
  30 second offered rate 57000 bps, drop rate 15000 bps
Match: any
  Bandwidth Estimation:
  Quality-of-Service targets:
    drop no more than one packet in 50 (Packet loss < 2.00%)
    delay no more than one packet in 50 by 100 (or more) milliseconds
    (Confidence: 98.0000%)
  Corvil Bandwidth: 327 kbits/sec
```

### SNMP: Monitoring Corvil Bandwidth Value

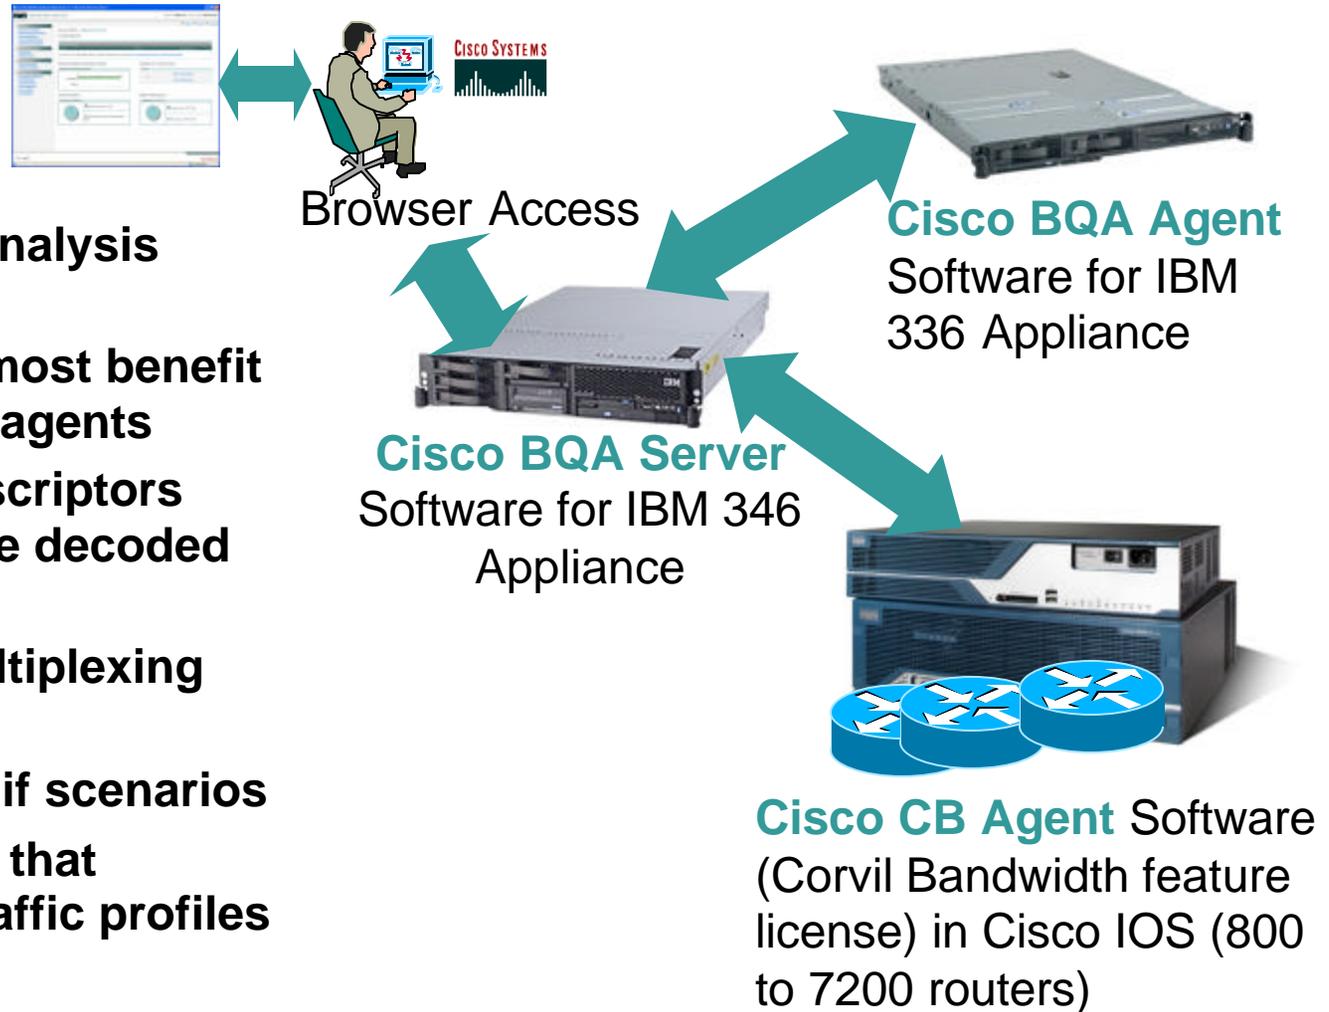

- Corvil BW for DE
- DE Pre Policy
- DE Post Policy

Cisco.com

# Case Study 5: QoS [18]

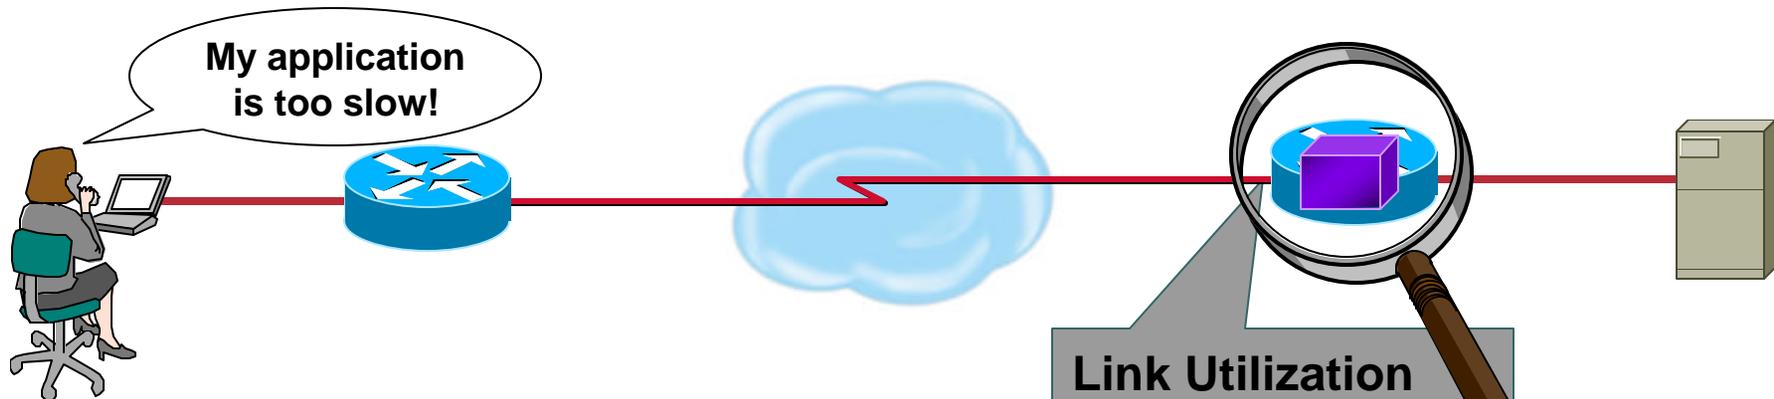

## Network Based Application Recognition (NBAR)

Cisco.com

- **QoS Case Studies so far**
  - ✓ **Network & Service response per Class of Service**
    - Ping/IP SLA**
  - ✓ **Device behaviour to QoS**
    - CLI / CBQoS MIB**
  - ✓ **Bandwidth required to meet defined SLA**
    - Corvil**
- **We Still Don't Know**
  - ✓ **What applications are generating the traffic**
  - ✓ **Traffic classification as it enters the network**
  - ✓ **Traffic flows in the Network**

# Case Study 5: QoS [19] NBAR

- Full-packet, stateful inspection identifies traffic type
- Protocol Discovery analyzes multi-packet behavior and application signatures
- Enables application of QoS policies to traffic flows

## Link Utilization

Citrix	25%
Netshow	15%
Fasttrack	10%
<b>FTP</b>	<b>30%</b>
HTTP	20%

Mark Citrix as **interactive** traffic  
and police FTP  
Assure bandwidth  
for Citrix!

# Case Study 4.5.2: QoS [20]

## NBAR Modes of Operation

- **Protocol Discovery Per Interface.**

```
R2-2821(config-if)#ip nbar protocol-discovery
```

**per-interface, per-protocol, bi-directional statistics:**

**bit rate (bps)**

**packet counts**

**byte counts**

- **Modular QoS Traffic Classification**

```
R2-2821(config)#class-map af4_toPE
R2-2821(config-cmap)#match protocol ?
  aarp                AppleTalk ARP
  appletalk           AppleTalk
  arp                 IP ARP
  bgp                 Border Gateway Protocol
  <snip>
  xwindows            X-Windows remote access
R2-2821(config-cmap)#match protocol Telnet
```

**Lists all NBAR protocols**

# Case Study 5: QoS [21]

## NBAR Protocol Discovery Configuration

Cisco.com

### Configuring Protocol Ports

```
(config)#ip nbar port-map bgp udp 179 180 181 182 183 184
(config)#ip nbar port-map custom-01 udp 1000 1100
(config)#ip nbar custom CiscoProtocol source udp
                        range 40000 41000 50000
```

- **Redefine existing protocol ports**
- **Configure custom protocols**
- **Define protocol by name**

### Identifying Protocol Ports

```
#show ip nbar port-map
port-map CiscoProtocol  udp 40000 41000 50000
port-map bgp            udp 179 180 181
                        182 183 184
port-map bgp            tcp 179
<snip>
port-map telnet         tcp 23
port-map tftp           udp 69
port-map vdolive        tcp 7000
port-map winmx          tcp 6699
```

- **List all protocols and ports**
- **Port-map and custom are maintained over reboot.**

# Case Study 5: QoS [22]

## NBAR CLI

- Top-N for all interfaces with Cisco NBAR Protocol Discovery enabled
- “show ip nbar protocol-discovery” lists all protocols including those with no applications.

```
#sh ip nbar protocol-discovery top-n 5 Serial0/3/0
```

	Input	Output
Protocol	Packet Count Byte Count 5min Bit Rate(bps) 5min Max Bit Rate(bps)	Packet Count Byte Count 5min Bit Rate(bps) 5min Max Bit Rate(bps)
gre	52270 1254480 23000 36000	0 0 0 0
egp	52269 1254456 23000 36000	0 0 0 0
CiscoProtocol	7975 255200 18000 18000	0 0 0 0

# Case Study 4.5.3: QoS [23]

## NBAR SNMP

- **CISCO-NBAR-PROTOCOL-DISCOVERY-MIB**

**SNMP configures and collects protocol discovery statistics**

```
snmpwalk cnpdAllStatsEntry
```

**Lists all protocol entries including those with 0 counters.  
99 protocols in this case**

**Top-N statistics must be configured via SNMP**

### SNMP SET

```
1: cnpdTopNConfigStatus.5 (integer) createAndWait(5)
2: cnpdTopNConfigIfIndex.5 (integer) 5 [5]
3: cnpdTopNConfigRequestedSize.5 (gauge) 6
4: cnpdTopNConfigStatsSelect.5 (integer) bitRateIn(1)
5: cnpdTopNConfigSampleTime.5 (gauge) 30
6: cnpdTopNConfigStatus.5 (integer) createAndGo(4)
```

**CreateAndWait for  
Interface ifindex 5**

**Create Top N  
protocol table  
For ifindex 5**

**Create Top 6  
protocol table**

**Order by inbound  
interface bit rate**

**1<sup>st</sup> two SNMP sets required  
and in order shown**

**Bit rate over  
30s interval**

**CreateAndGO top 6 protocol  
table for ifindex 5 (Serial 0/3/0)**

# Case Study 5: QoS [24]

## NBAR SNMP

- Top N protocols are listed  
Based on counters

- Counters are:
  - Bit rate/s 30s interval
  - Inbound on Serial 0/3/0
  - As configured via SNMP

- NBAR Protocol Traps configured via SNMP

Based on

- Any protocol
- Defined protocol
- Combination of threshold conditions

### SNMP GET/WALK cnpdTopNStatsEntry

```

1: cnpdTopNStatsProtocolName.5.1   egp
2: cnpdTopNStatsProtocolName.5.2   gre
3: cnpdTopNStatsProtocolName.5.3   CiscoProtocol
4: cnpdTopNStatsProtocolName.5.4   l2tp
5: cnpdTopNStatsProtocolName.5.5   notes
6: cnpdTopNStatsProtocolName.5.6   rtp1
<snip>

4: cnpdTopNStatsHCRate.5.4 (counter64) 2000
5: cnpdTopNStatsHCRate.5.5 (counter64) 2000
6: cnpdTopNStatsHCRate.5.6 (counter64) 2000
    
```

# Case Study 5: QoS [25]

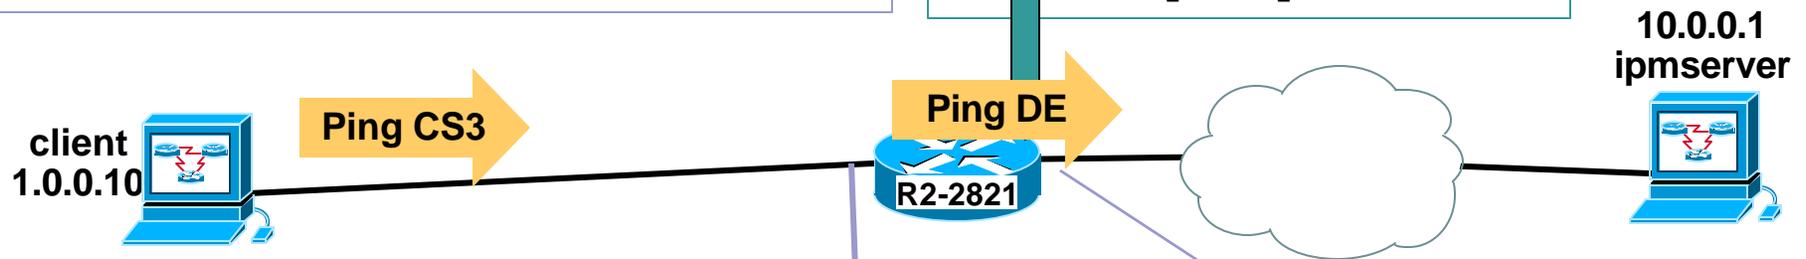

## NBAR + CBQoSMIB

**DSCP=CS3**

```
Client% ping -n 10 -v 96 10.0.0.1
Pinging 10.0.0.1 with 32 bytes of data:
Reply from 10.0.0.1 : bytes=32 time=1ms
TTL=63
<SNIP>
Packets: Sent = 10, Received = 10,
Lost = 0 (0% loss)
```

```
class EF
priority 10
police cir 10000
conform-action transmit
exceed-action drop
class AF4
bandwidth 20
class class-default
set ip dscp default
```

Without this we don't know QoS markings in network

**Don't know QoS Marking Into Network**

- ✓ **NBAR** Identifies protocol but not QoS marking
- ✓ **CBQoS** identifies device behaviour but not Pre QoS marking

**NBAR**

Protocol	Input Packet Byte	Output Packet Byte
icmp	10	10
	640	640

**CBQoSMIB**

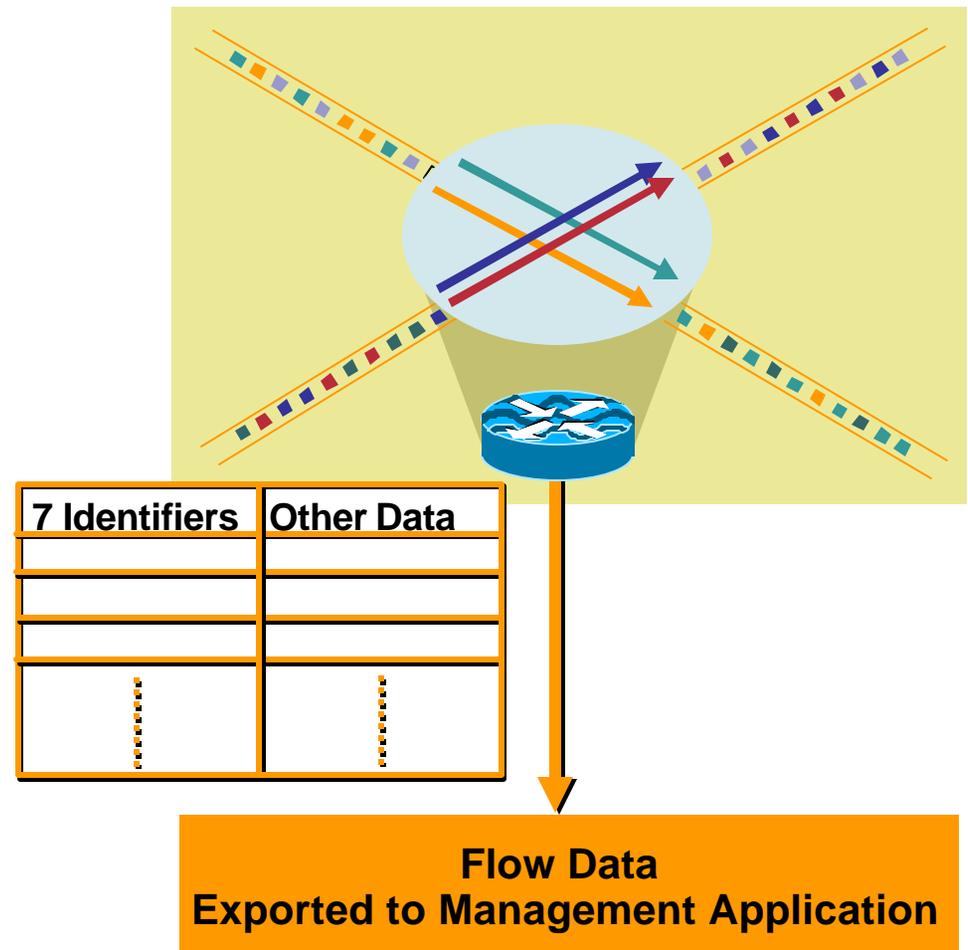

Class	Packet	Byte
EF	0	0
AF4	0	0
DE	10	640

# Case Study 5: QoS [26]

## NetFlow

### NMS-3132 - Advanced NetFlow Usage

- **NetFlow**
  - ✓ Inspects packets
  - ✓ Provides flow information Per Class of Service (TOS)
  - ✓ Provides pre and post policy QoS classification
- **Flows are defined by 7 keys:**
  - Source IP address
  - Destination IP address
  - Source port
  - Destination port
  - Layer 3 protocol
  - TOS byte (DSCP)
  - Input interface (ifIndex)

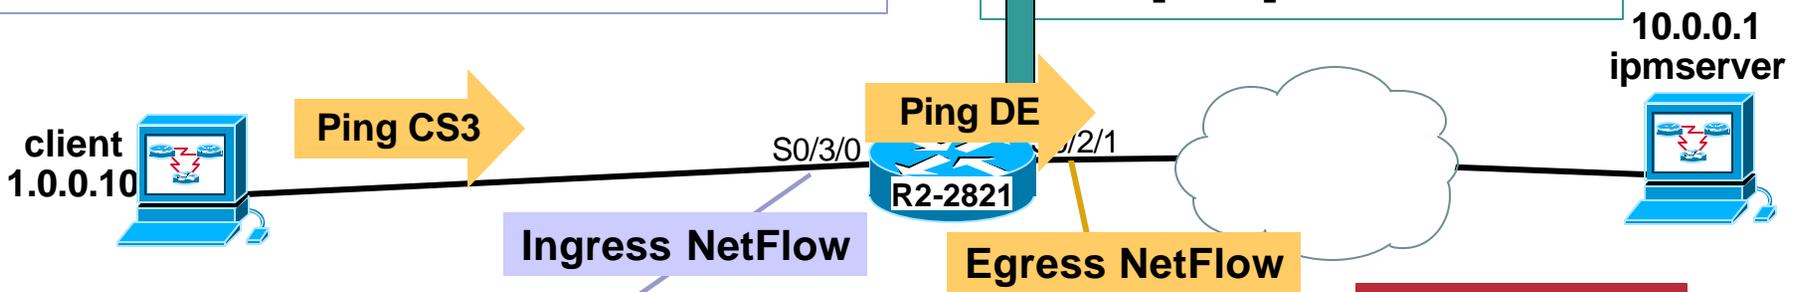

# Case Study 5: QoS [27] NetFlow

**DSCP=CS3**

```
Client% ping -n 10 -v 96 10.0.0.1
Pinging 10.0.0.1 with 32 bytes of data:

```

### SNMP: NetFlow MIB

cnfTopFlowsSrcAddress	cnfTopFlowsDstAddress	cnfTopFlowsTOS	cnfTopFlowsBytes
.1 0A.0A.0A.01	.1 0A.0A.0A.04	.1 0	.1 364980
.2 0A.0A.0A.01	.2 0A.0A.0A.04	.2 0	.2 364980
.15 01.00.00.0A	.15 0A.00.00.01	.15 0	.15 48480
.16 01.00.00.0A	.16 0A.00.00.01	.16 96	.16 48480

# Case Study 5: QoS [30]

## NetFlow: Configuration Tips

- **When monitoring NetFlow via CLI**  
increase inactive timers
- **When exporting NetFlow records to a NetFlow collector (NFCv5)**  
Timers should not be longer than NFC collector aggregator interval

Long Cache timers will skew NFC data

- **Default Cache timers**
- **Easy to miss short flows via CLI**

```
R2-2821#sh ip cache flow
<SNIP>
IP Flow Switching Cache, 278544 bytes
  2 active, 4094 inactive, 1760 added
141533 age polls, 0 flow alloc failures
Active flows timeout in 30 minutes
Inactive flows timeout in 15 seconds
<SNIP>
```

- **Increases inactive flow timer**
- **All udp flows are inactive**

```
R2-2821(config)#ip flow-cache timeout inactive 120
```

# Case Study 5: QoS [31]

## NetFlow: TOS-Aggregations

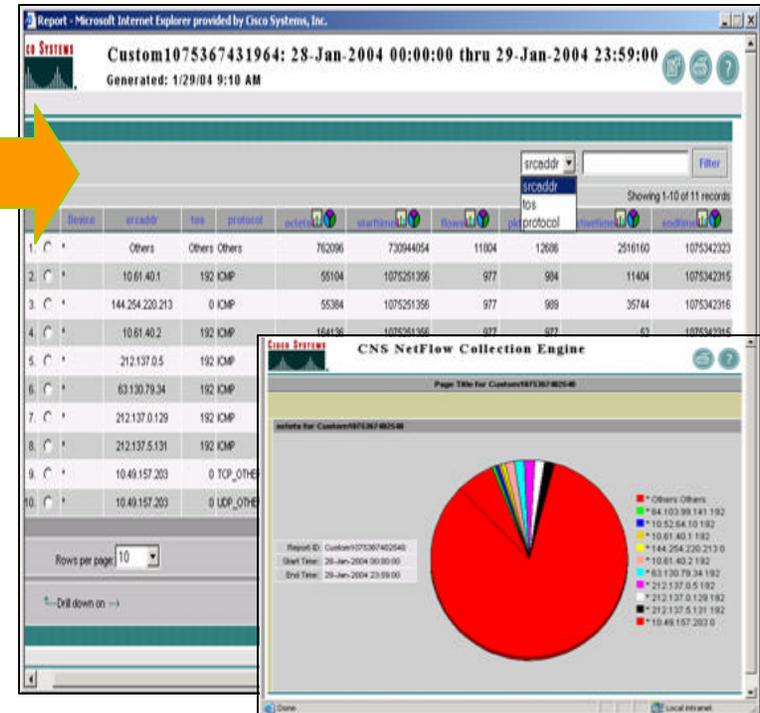

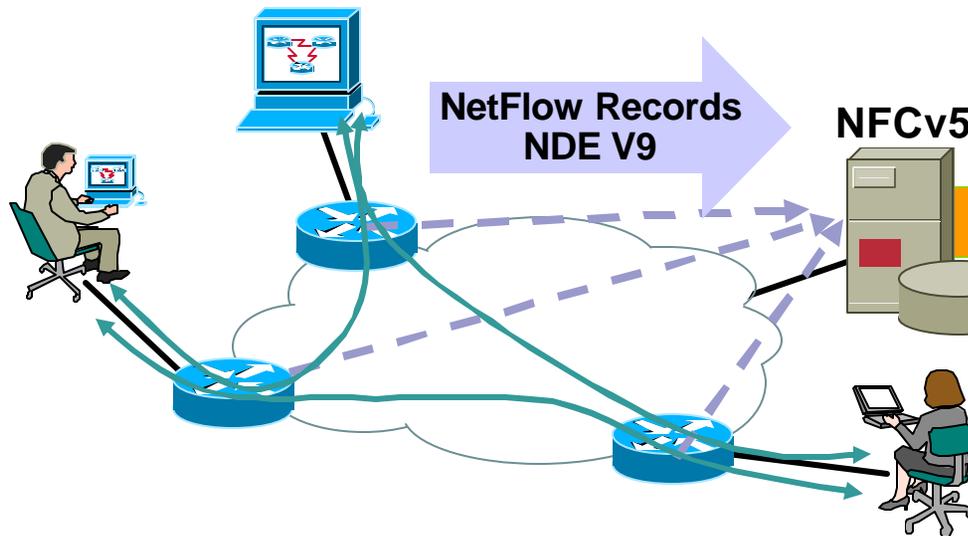

- **NetFlow ToS-Aggregation schemes reduce**
  - CLI: Show Cache flow output**
  - NDE: data exported to the NetFlow Collector**
- **If Aggregation is used then**
  - Only export aggregated data to the collector**
  - Set timers in main cache to default**

```
R2-2821#sh ip cache flow aggregation ?
as-tos                AS TOS aggregation cache
bgp-next-hop-tos     BGP next-hop TOS aggregation cache
destination-prefix-tos Destination Prefix TOS aggregation cache
prefix-tos           Source/Destination Prefix TOS aggregation
                    cache
protocol-port-tos    Protocol, port, TOS aggregation cache
source-prefix-tos    Source Prefix TOS aggregation cache
```

# Case Study 5: QoS [32]

## NetFlow: NetFlow Collector V5 (NFCv5)

Cisco.com

- **IP Flows captured on device interface**  
Ingress or Egress
- **Flows stored in device cache**
- **Flows exported to NetFlow collector**  
Cache timers default inactive=15s, active=30s
- **NFCv5 Aggregation scheme**  
Listens on udp port  
Aggregates flows over time interval & key flow fields

# Case Study 5: QoS [33] NetFlow: NetFlow Collector (NFCv5)

## CASE STUDY 6: Embedded Management

# Case Study 6: Embedded Management [1]

- **What is Embedded Management ?**
  - ✓ On Device monitoring of Elements and network services
  - ✓ No external monitoring
  - ✓ Ability to send traps on the crossing of thresholds
  - ✓ Take action based on threshold crossed
- **Why Embedded Management is used ?**
  - ✓ Reduce network overhead
  - ✓ Scalable performance monitoring
  - ✓ High speed monitoring
- **Cisco's Embedded Management**
  - COOL, IPSLA (Service/Availability)
  - RMON, Embedded Event Manager (Any MIB object)

# Case Study 6: Embedded Management [2]

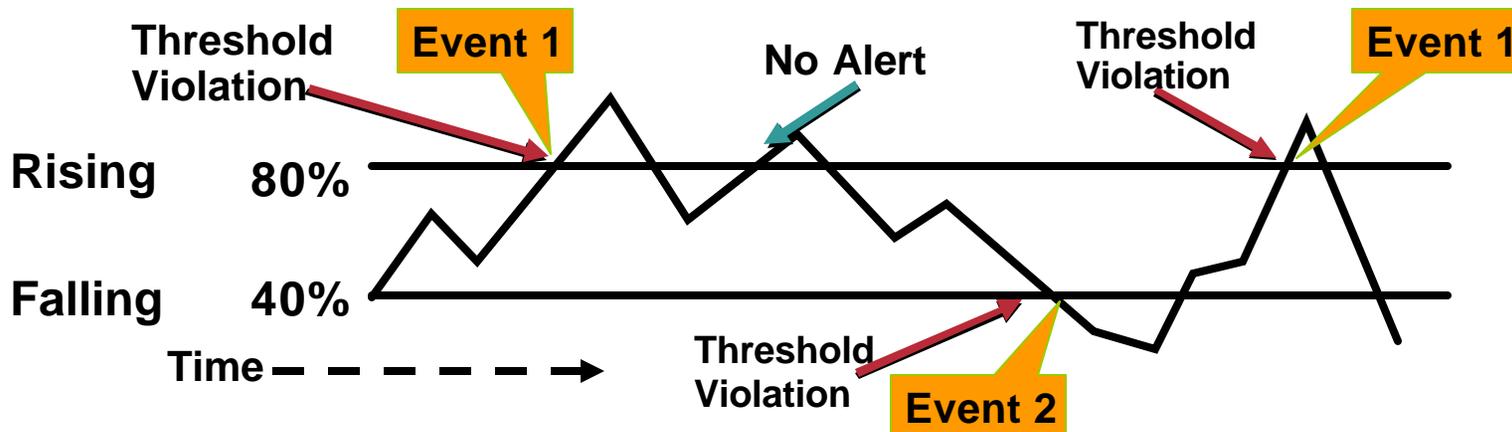

## RMON: CPU Utilization

- Configure RMON to generate a trap if CPU utilization reaches or exceeds 80%, and rearm the trap if utilization drops to 40% or less, sampling interval is 20 seconds

Rising Condition

Falling Condition

```
Router(config)#rmon alarm 1 cpmCPUTotalEntry.3.0 20 absolute  
rising-threshold 80 1 falling-threshold 40 2 owner me  
  
Router(config)#rmon event 1 log trap public description "cpu  
busy" owner me  
  
Router(config)#rmon event 2 log description "cpu not too busy"
```

# Case Study 6: Embedded Management [3]

## EEM: CPU Utilization

- **The following configuration example generates a syslog message to be logged when**
  - CPU utilization goes above 90%**
  - Event monitoring will resume when the CPU utilization falls below 80% or when 20 minutes have passed**

```
Event Manager applet totcpualert
event snmp oid 1.3.6.1.4.1.9.9.109.1.1.1.1.6.1 get-type
exact entry-op ge entry-val 90 exit-comb or exit-op le
exit-val 80 exit-time-sec 1200
action syslog priority alert msg *** Warning*** CPU
utilization is above 90%
```

- **More flexible than RMON event and alarm**

# Summary and Conclusion

- **Starting point should be monitoring the Service**
  - Identify what the service is.
  - Where Service Information is available.
- **Quality of service is dependant on underlying infrastructure**
  - QoS is key to delivery of multiple services over a network.
- **Deployed device instrumentation is preferred**
  - Deployed in all parts of the network & already managed.
- **The performance monitoring cycle is an ongoing process**
  - Define service, Baseline, Collect data Process.
  - Needs to be constantly tuned

# Questions?

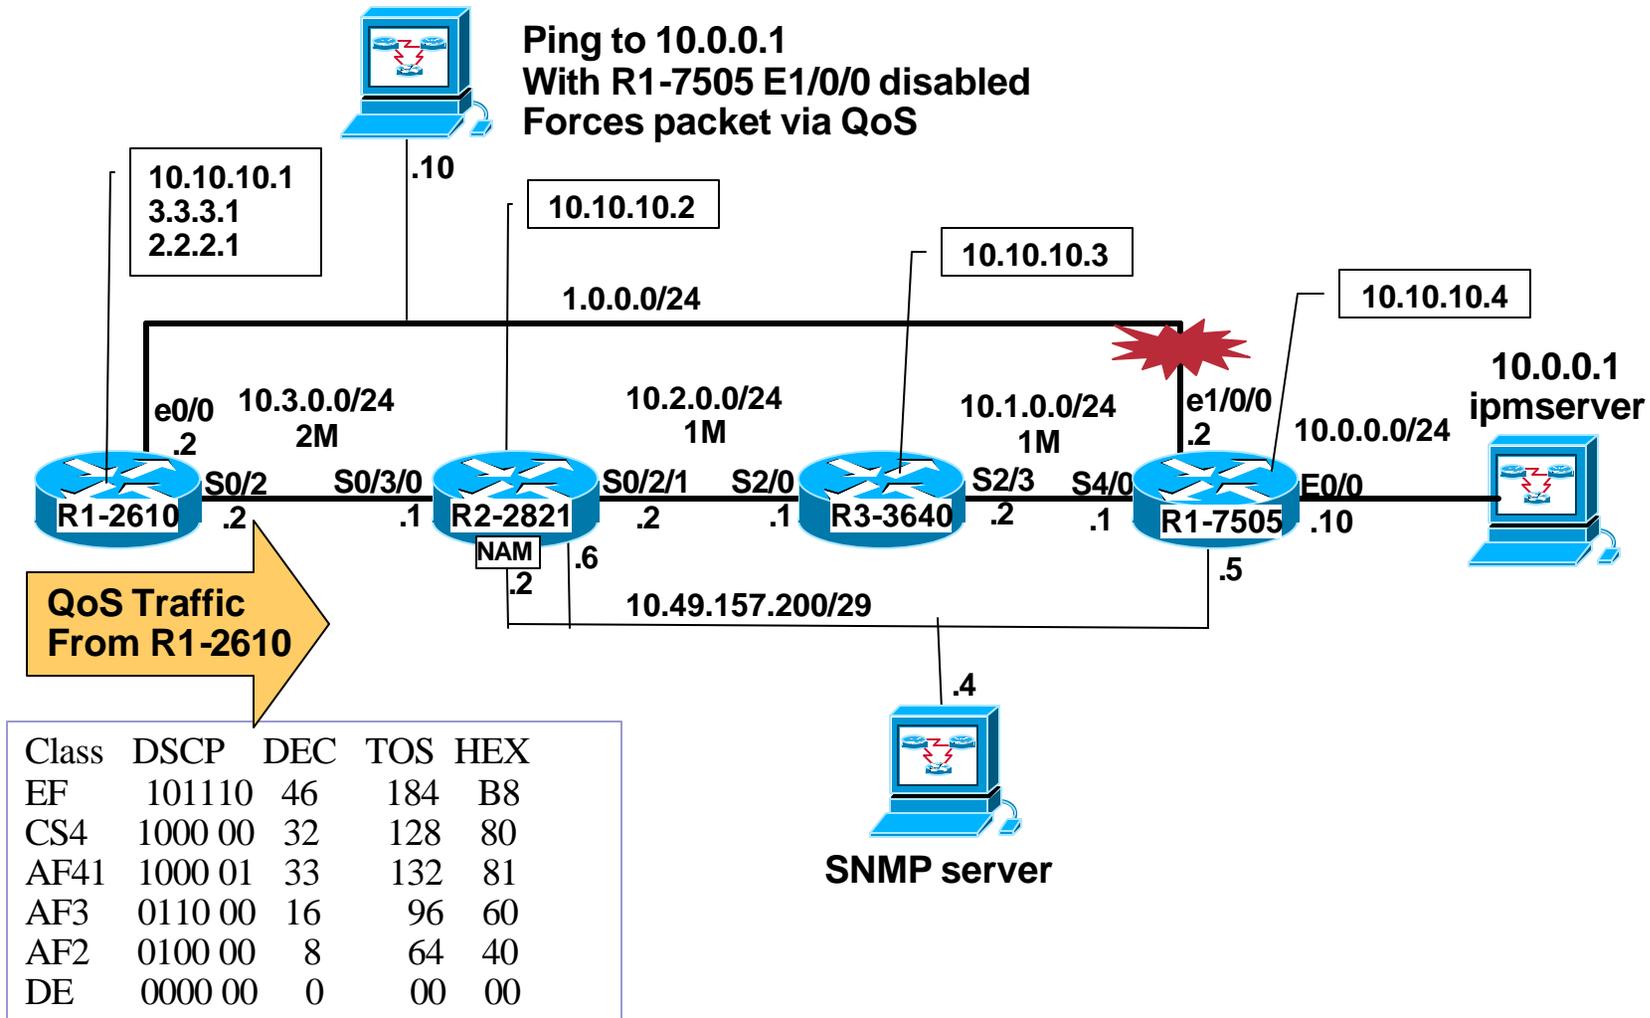

Cisco.com

# CISCO SYSTEMS

# Appendix A: Reference Network for Case Studies

# Appendix B CASE STUDY 7: Device Elements

# Case Study 7: Device Elements [1]

## CPU Utilization: CLI Commands

- Routers running constantly at high utilization level can affect the overall performance of forwarding and processing packets

```
Router#sh proc cpu
CPU utilization for five seconds: 50%/20%; one minute:5%; five minutes:2%
  PID Runtime(ms)   Invoked    uSecs   5Sec   1Min   5Min  TTY Process
    1         0           1          0  0.00%  0.00%  0.00%  0 Chunk Mgr
    2        368       274108        1  0.00%  0.00%  0.00%  0 Load Meter
    3       32940      716632       45  0.00%  0.00%  0.00%  0 OSPF Hello

Router#sh proc cpu sorted ?
 1min  Sort based on 1 minute utilization
 5min  Sort based on 5 minutes utilization
 5sec  Sort based on 5 seconds utilization
 |     Output modifiers
```

# Case Study 7: Device Elements [2]

## CPU Utilization: SNMP

- CPU utilization using OLD-CISCO-CPU MIB
- Supported since 10.2
- As of 12.0 all OLD-CISCO-\* MIBs are “deprecated”

```
Router#sh proc cpu
```

```
CPU utilization for five seconds: 50%/20%; one minute:5%; five minutes: 2%
```

PID	Runtime(ms)	Invoked	uSecs	5Sec	1Min	5Min	TTY	Process
1	0	1	0	0.00%	0.00%	0.00%	0	Chunk Mgr
2	368	274108	1	0.00%	0.00%	0.00%	0	Load Meter
3	32940	716632	45	0.00%	0.00%	0.00%	0	OSPF Hello

- OLD-CISCO-CPU MIB only applies to RP CPU
- OLD-CISCO-CPU MIB doesn't apply to CPU utilization for VIP cards (7500) or LC (GSR)

# Case Study 7: Device Elements [3]

## CPU Utilization: SNMP

- **CISCO-PROCESS-MIB: New MIB introduced in 12.0T train; provides information on CPU utilization and running processes**

```
Router#sh proc cpu
CPU utilization for five seconds: 50%/20%; one minute:5%; five minutes: 2%
PID Runtime(ms)   Invoked    uSecs   5Sec   1Min   5Min  TTY Process
  1         0           1         0  0.00%  0.00%  0.00%  0 Chunk Mgr
  2        368       274108     1  0.00%  0.00%  0.00%  0 Load Meter
  3       32940     716632    45  0.00%  0.00%  0.00%  0 OSPF Hello
```

cpmCPUTotal5sec

cpmCPUTotal1min

cpmCPUTotal5min

- **Solution for VIP cards(7500) and LC(GSR):  
CISCO-PROCESS-MIB + ENTITY-MIB**

cpmProcessEntry  
cpmProcessExtRevEntry

# Case Study 7: Device Elements [4]

## CPU Utilization: SNMP for VIP and LC

- The ENTITY-MIB provides an inventory of the chassis, cpu card(s), line cards, fans, power supplies etc.; this MIB is the industry-standard replacement to the OLD-CISCO-CHASSIS-MIB
- Which MIB variables to use for VIP and LC?

```
cpmCPUTotalTable
```

```
cpmCPUTotalIndex Unsigned32,
```

```
cpmCPUTotalPhysicalIndex EntPhysicalIndexOrZero,
```

```
cpmCPUTotal5sec Gauge32,
```

```
cpmCPUTotal1min Gauge32,
```

```
cpmCPUTotal15min Gauge32,
```

```
INDEX { cpmCPUTotalIndex }
```

**CISCO-PROCESS  
MIB**

**Assigned Arbitrarily and Is  
Not Saved Over Reboots**

**Defined in Another  
Variable entPhysicalEntry  
in the ENTITY-MIB**

# Case Study 7: Device Elements [5]: CPU Utilization: VIP & ENTITY & CISCO-PROCESS MIBs

Cisco.com

- **CISCO-PROCESS-MIB:**

```
cpmCPUTotalTable.cpmCPUTotalEntry.cpmCPUTotalPhysicalIndex.1 :  
    INTEGER: 0
```

```
cpmCPUTotalTable.cpmCPUTotalEntry.cpmCPUTotalPhysicalIndex.2 :  
    INTEGER: 28
```

```

# Case Study 7: Device Elements [8]

## Memory Utilization: CLI Commands

- The amount of main memory left on a router's processor has significant impact on performance

```
Router# show memory
```

	Head	Total(b)	Used(b)	Free(b)	Lowest(b)	Largest(b)
Processor	60DB19C0	119858752	1948928	117909824	117765180	117903232
Fast	60D919C0	131072	69560	61512	61512	6146 ...

- Buffers are allocated from memory into different memory pools

```
Router# show buffers
```

```
Buffer elements:
```

```
499 in free list (500 max allowed)
```

```
124485689 hits, 0 misses, 0 created
```

```
Public buffer pools:
```

```
Small buffers 104 bytes (total 120, permanent 120:
```

```
112 in free list (20 min, 250 max allowed)...
```

# Case Study 7: Device Elements [9]

## Memory Utilization: SNMP

- Initially OLD-CISCO-MEMORY MIB
- CISCO-MEMPOOL-MIB only supports RP

Router# show memory

	Head	Total(b)	Used(b)	Free(b)	Lowest(b)	Largest(b)
Processor	60DB19C0	119858752	1948928	117909824	117765180	117903232
Fast	60D919C0	131072	69560	61512	61512	6146

- Solution for VIP cards(7500) and LC(GSR): CISCO-ENHANCED-MEMPOOL MIB
- CISCO-ENHANCED-MEMPOOL MIB is supported from 12.0(21)S for VIP cards and 12.0(20)ST for GSR LCs

# Case Study 7: Device Elements [10]
